

# Chapter 10: Assembler For Dummies

*In which we learn that working with dummies can be the smart thing to do.*

We begin this chapter by reviewing two assembler directives.

## USING and DROP

The assembler converts many of the symbols we use into base/displacement addresses. Each address contains a base register and a displacement from a known address in our program. In building a program, we have control over which registers and base addresses are used at various points in the program. A USING statement is a directive to the assembler that controls which registers will be selected and the locations of the base addresses of those registers.

An ordinary USING statement is typically coded by naming a base address (most often a relocatable expression) in operand 1, followed by one or more registers. If \* is used as a base address, it refers to the current value of the location counter. A base address is associated with each named register. The base address specified in operand 1 is associated with the first named register. If multiple registers are coded, the base address is increased by 4k for each subsequent register. Here are some examples.

USING	*	R12	BASE ADDRESS FOR R12 = CURRENT LOCATION BASE REGISTER = 12
USING	*	R12, R11, R10	BASE ADDRESS FOR R12 = CURRENT LOCATION BASE ADDRESS FOR R11 = CURRENT LOCATION+4096 BASE ADDRESS FOR R10 = CURRENT LOCATION+8192 BASE REGISTERS = 12, 11, 10
USING	HERE	R12, R11	BASE ADDRESS FOR R12 = ADDRESS OF HERE BASE ADDRESS FOR R11 = ADDRESS OF HERE+4096 BASE REGISTERS = 12, 11

It's a common practice for programmers to use 12 as the first base register and work backwards in sequence if more base registers are needed. This is not a requirement, but simply a programming convention. The use of register 0 in a USING statement as a base register is a rare occurrence and beyond the scope of this discussion.

In processing a USING statement, the assembler records each register and its associated base address in a table called the *USING table*. The assembler consults the USING table whenever it converts a symbolic name to a base/displacement address. Registers are first added to the table by coding them in a USING statement. The base address associated with a register can be changed in the table by recoding the same register in a USING with a different base address. Finally, a register can be removed from the USING table altogether by coding it in a DROP statement. Here are some typical DROP statements.

```
DROP    R12
DROP    R12, R11, R10
```

As programs grow larger we often need to add more base registers, and as a result, available registers can become scarce. The DROP statement gives us the ability to tell the assembler to stop
