Guerri, 2022-02-28 This new edition of a previous bestseller gives you practical techniques for optimizing RF and microwave circuits for applications in radar systems design with an emphasis on current and emerging technologies Completely updated with new material the book shows you how to design RF components for radar systems and how to choose appropriate materials and packaging

methods It takes you through classic techniques to the state of the art and finally to emerging technologies You will learn How to design high frequency circuits for use in radar applications How to integrate components while avoiding higher level assembly issues and troubleshooting problems on the measurement bench How to properly simulate build assemble and test high frequency circuits How to debug issues with hardware on the bench How to connect microwave theory to practical circuit design Theory and practical information are provided while addressing topics ranging from heat removal to digital circuit integration The book serves as a teaching aid for classic techniques that are still relevant today It also demonstrates how these techniques are serving as the foundation for technologies to come You will be equipped to consider future needs and emerging enabling technologies and confidently think and design outside the box to ensure future needs are met The book also shows you how to incorporate modern design techniques often overlooked or underused and will help you to better understand the capabilities and limitations of today s technology and the emerging technologies that are on the horizon to mitigate those limitations This is a must have resource for system level radar designers who want to up their game in RF microwave component design It is also a great tool for RF microwave engineers tasked or interested in designing components for radar systems Students and new designers of radar components will also benefit and be well prepared to start designing immediately

Programming and Application of a DSP to Control and Regulate Power Electronic Converters: Programming in C++ Baris Bagci,2014-03-01 The purpose of this project has been to study operate and program the 32 bit 150MIPS TMS320F2812 DSP developed by Texas Instruments Inc In addition it has also been a goal to implement fast estimation techniques for control of resonant converters For this purpose PWM signals that are generated using this DSP are used The demands on the system and the hardware to solve the problem were already decided when I started the work The algorithms were programmed in C C language compiled debugged and transferred to the DSP development board in a compiling and simulation tool downloader called CCS Code Composer Studio v2 also provided by Texas Instruments In the first chapters of this study I give general information about control systems digital signal processors digital signal processing and the DSP used in this work The following chapters tell about PWM how to configure the PWM outputs and some examples related with PWM signals are given After a short review of series resonant converters I presented the last example implemented in this project I conclude with a summary and provide some hints of future work
