

Foundation Engineering

- Structural Foundations are the substructure elements which transmit the structural load to the earth in such a way, that the supporting soil is not over-stressed and not undergo deformations that would cause excessive settlement of the structure.
- Hence the properties of the supporting soil must be expected to affect the choice of type of structural foundation suitable for the structure.
- The failure of foundation will be due to
 - (i) settlement of soil / foundation.
(It is called as settlement failure)
 - (ii) sliding / slipping of soil / foundation.
(It is called as shear failure)
- The foundation should be safe in shear criteria and settlement criteria.

Types of foundation :-

SHALLOW FOUNDATION	DEEP FOUNDATION
→ Terzaghi, $\frac{D_f}{B} \leq 1$ → carries the load due to Base Resistance	→ Terzaghi, $\frac{D_f}{B} > 1$ → carries load due to side as well as base resistance

Kulhawy,1989 **Soil Mechanics and Foundation Engineering** ,1975 **XIVth International Conference on Soil Mechanics and Foundation Engineering, volume 2** ISSMFE Society,2026-02-20 The most important conference on soil mechanics and foundation engineering held every four years All papers were selected and reviewed by the national societies of the ISSMFE Nearly all papers in English Topics Terzaghi oration Geotechnical aspects of earthquakes of 1995 Heritage lecture Geotechnics in Germany Geotechnical aspects of the Great Belt Project and of the Oeresund Projects Reduction of the differential settlements of the Metropolitan Cathedral in Mexico City by means of under excavation Soil testing and ground property characterization Recent developments in foundation techniques Retaining structures and excavated slopes Underground works in urban environment Soil improvement and reinforcement Waste disposal and contaminated sites Recent developments in laboratory stress strain testing Ground property characterization by means of insitu tests Interplay between physical and numerical models as applied in engineering practice **Sustainable Materials and Technologies under Climate Change Scenario** Hanuman Devidas Chalak,Ashwani Jain,Praveen Aggarwal,2026-01-01 This book encompasses economic social and environmental dimensions aiming for a balance that ensures the well being of both people and the planet over the long term Sustainability and environmental protection are crucial topics in today s world Sustainability refers to the ability to meet the needs of the present without compromising the ability of future generations to meet their own needs Addressing these issues requires collaboration innovation and a commitment to change at all levels of society By prioritizing sustainability and environmental protection we can work toward a healthier more equitable and more resilient future for all Sustainability of a system is its ability to survive and retain its functionality over time For an engineered system to be sustainable it should be efficient reliable resilient and adaptive Thus the objective of sustainable engineering is to ensure the integration of an engineered system into the natural and man made environment without compromising the functionality of either the engineered system or that of the ecosystem and society and this harmony between the natural and built environments must be maintained at the local regional and global scales Therefore in the engineering domain sustainability can be looked upon as a dynamic equilibrium between four E s engineering design economy environment and equity As climate change and resource scarcity continue to pose major challenges there is an urgent need for more sustainable solutions in construction industry In response to these challenges the construction industry is actively exploring and implementing more sustainable practices and materials This shift aims to reduce the environmental impact of material production extend the service life of structures and minimize resource consumption Researchers industry

professionals and policymakers are collaborating to develop and promote innovative technologies materials and strategies that can significantly reduce the carbon footprint energy use and waste generation associated with construction

Foundation Engineering Analysis and Design An-Bin Huang,Hai-Sui Yu,2017-12-06 One of the core roles of a practising geotechnical engineer is to analyse and design foundations This textbook for advanced undergraduates and graduate students covers the analysis design and construction of shallow and deep foundations and retaining structures as well as the stability analysis and mitigation of slopes It progressively introduces critical state soil mechanics and plasticity theories such as plastic limit analysis and cavity expansion theories before leading into the theories of foundation lateral earth pressure and slope stability analysis On the engineering side the book introduces construction and testing methods used in current practice Throughout it emphasizes the connection between theory and practice It prepares readers for the more sophisticated non linear elastic plastic analysis in foundation engineering which is commonly used in engineering practice and serves too as a reference book for practising engineers A companion website provides a series of Excel spreadsheet programs to cover all examples included in the book and PowerPoint lecture slides and a solutions manual for lecturers Using Excel the relationships between the input parameters and the design and analysis results can be seen Numerical values of complex equations can be calculated quickly non linearity and optimization can be brought in more easily to employ functioned numerical methods And sophisticated methods can be seen in practice such as p y curve for laterally loaded piles and flexible retaining structures and methods of slices for slope stability analysis
