P. Parsley,2011 This thesis is concerned with Simultaneous Localisation and Mapping SLAM a technique by which a platform can estimate its trajectory with greater accuracy than odometry alone especially when the trajectory incorporates loops We discuss some of the shortcomings of the classical SLAM approach in particular EKF SLAM which assumes that no information is known about the environment a priori We argue that in general this assumption is

needlessly stringent for most environments such as cities some prior information is known We introduce an initial Bayesian probabilistic framework which considers the world as a hierarchy of structures and maps such as those produced by SLAM systems as consisting of features derived from them Common underlying structure between features in maps allows one to express and thus exploit geometric relations between them to improve their estimates We apply the framework to EKF SLAM for the case of a vehicle equipped with a range bearing sensor operating in an urban environment building up a metric map of point features and using a prior map consisting of line segments representing building footprints We develop a novel method called the Dual Representation which allows us to use information from the prior map to not only improve the SLAM estimate but also reduce the severity of errors associated with the EKF Using the Dual Representation we investigate the effect of varying the accuracy of the prior map for the case where the underlying structures and thus relations between the SLAM map and prior map are known We then generalise to the more realistic case where there is clutter features in the environment that do not relate with the prior map This involves forming a hypothesis for whether a pair of features in the SLAM state and prior map were derived from the same structure and evaluating this based on a geometric likelihood model Initially we try an incremental Multiple Hypothesis SLAM MHSLAM approach to resolve hypotheses developing a novel method called the Common State Filter CSF to reduce the exponential growth in computational complexity inherent in this approach This allows us to use information from the prior map immediately thus reducing linearisation and EKF errors However we find that MHSLAM is still too inefficient even with the CSF so we use a strategy that delays applying relations until we can infer whether they apply we defer applying information from structure hypotheses until their probability of holding exceeds a threshold Using this method we investigate the effect of varying degrees of clutter on the performance of SLAM

Switchable Constraints for Robust Simultaneous Localization and Mapping and Satellite-Based Localization Niko Sünderhauf, 2023-05-01

Simultaneous Localization and Mapping SLAM has been a long standing research problem in robotics It describes the problem of a robot mapping an unknown environment while simultaneously localizing in it with the help of the incomplete map This book describes a technique called emph Switchable Constraints Switchable Constraints help to increase the robustness of SLAM against data association errors and in particular against false positive loop closure detections Such false positive loop closure detections can occur when the robot erroneously assumes it re observed a landmark it has already mapped or when the appearance of the observed surroundings is very similar to the appearance of other places in the map Ambiguous observations and appearances are very common in human made environments such as

office floors or suburban streets making robustness against spurious observations a key challenge in SLAM The book summarizes the foundations of factor graph based SLAM techniques It explains the problem of data association errors before introducing the novel idea of Switchable Constraints We present a mathematical derivation and probabilistic interpretation of Switchable Constraints along with evaluations on different datasets The book shows that Switchable Constraints are applicable beyond SLAM problems and demonstrates the efficacy of this technique to improve the quality of satellite based localization in urban environments where multipath and non line of sight situations are common error sources
