

Understanding Wet-Mix Shotcrete: Mix Design, Specifications, and Placement

This paper was initially presented at the conference Surface Support Liners 2003, held in Quebec City, Canada, August 25-26, 2003 (www.liners2003.gmn.ulaval.ca).

by Marc Jolin and Denis Beaupré

The purpose of this article is to examine the use of modern wet-mix shotcrete in underground environments. A critical review is provided of aspects such as mixture design, specifications, and placement. More specifically, the intent of this article is to identify the limits of the wet-mix shotcrete process, examine actual mix designs, discuss the various methods of determining (and specifying) the early-age properties of shotcrete (< 1 day), and review shotcrete placement properties, especially pumping the fresh concrete. The presentation treats various subjects taking into account actual field practices as well as the results of on-going research at Laval University, QC, Canada.

Introduction

Maintenance of the stability of an underground opening often requires the engineer to specify some sort of support system. Generally, this support system takes the form of a composite structure, which can include rock bolts, welded wire mesh, steel sets, lattice girders, and/or shotcrete. If shotcrete is included as an element of the support system, it can play different roles. First, it can be used as a simple protective layer to isolate the exposed rock from the ambient air. It can also be used as a structural layer, where it is used in combination with rock bolting and/or steel sets or lattice girders. In this case, shotcrete is structural in the sense that it offers support between the rock bolts and the steel sets or lattice girders. This type of support is intended to provide local stability of the excavation and prevent fallouts of blocks of rock. Finally, shotcrete can be used in some openings to provide a complete structural support, a shell action, to the surrounding ground. These generally thicker shells of shotcrete, working mostly in compression, are usually reinforced and may also incorporate fibers.

In this paper, it is assumed that wet-mix shotcrete has been selected as an element of the support system. Different aspects related to the design, specifications, and placement of wet-mix shotcrete in an underground environment are examined. More specifically, the wet-mix shotcrete process is assessed by examining the following items:

- Batching, mixing, and pumping wet-mix shotcrete (all the way to the nozzle);
- Placing wet-mix shotcrete; and
- Testing and evaluating in-place wet-mix shotcrete.

In other words, the reader is shown some of the possibilities of the wet-mix shotcrete while keeping a critical eye open, either for misconceptions often found in the concrete industry or for new and useful information originating from recent shotcrete research.

Batching, Mixing, and Pumping Wet-Mix Shotcrete

This part of the shotcrete process is probably the one that benefited most from recent advances in the concrete admixture technology. Indeed, it is now possible to mix and pump concretes that will reach 60 MPa (8700 psi) compressive strengths thanks to the use of high-range water reducers and superplasticizers that allow mixtures to be designed with water/cementitious material ratios (w/cw) as low as 0.35. It is also now possible to produce robust and flexible mixtures that will not cause unwanted surprises when it is time to pump, even with significant amounts of steel or synthetic fibers included in the mix.

Keeping in mind the pumpability requirements, two important approaches have been increasingly used in the past few years to increase the robustness against potential pumping problems: the optimization of the aggregate phase and the use of the concept of temporary high initial air content. These two approaches are discussed in the following sections.

Pumping Wet-Mix Shotcrete: Optimization of the Aggregate Phase

Batching and mixing a high-quality and pumpable wet-mix shotcrete is not always a simple task, particularly when high dosages of fibers are used. Using a classic mix design approach for conventional concrete may result in non-pumpable or difficult to pump concretes. Adding fibers to ordinary wet-mix shotcrete can produce similar effects. Also, keep in mind that the addition of a
