BIRD BEAKS Name: _____

Adaptations are body parts that help a species survive in their environment. Each of the three species described below live in a different environment, which means that they will each have different body parts that help them. Read about each of the birds to learn about how their beaks are adapted for their habitats.

Woodpecker
Woodpeckers forage (search) for small bugs in the water. They eat many insects, flies, and worms. Sometimes they also eat small fish. They capture these creatures by conforming to a specific rhythm in the water with their beaks. Unlike anything else, they come from inside to outside, they take a slightly open to capture any prey. Sometimes woodpeckers may also come at the water or even change their heads under water to grab prey that is deeper below the surface.

Kingfisher
Kingfishers are carnivorous birds whose diet consists mostly of fish. Sometimes they swim and other birds. To capture their prey, kingfishers swoop down from the sky and grab the unsuspecting fish or bird with their beaks (the sharp edges on their feet). When it's time to eat, the kingfisher then goes with one of its beaks and rips the fish off the hook with its beak.
