

# PS.14 THE SENSITIVITY OF WRF SIMULATIONS OF HURRICANE IVAN TO CHOICE OF CUMULUS PARAMETERIZATION

Megan S. Gentry\* and Gary M. Lackmann  
North Carolina State University

## 1. INTRODUCTION

As progressively smaller grid spacing is used in numerical modeling of mesoscale weather systems, explicit simulation of convection without parameterization has become more common. However, to our knowledge, the appropriateness of omitting the cumulus parameterization (CP) scheme at smaller grid spacing (4 km or less) has not been systematically determined in a tropical environment, particularly for tropical cyclones. The objective of this study is to observe the effects of explicitly resolving convection in a tropical cyclone, as opposed to using a convective parameterization. It is our hypothesis that explicit treatment of convection will provide a more realistic representation of the hurricane secondary circulation, eye and eyewall structure, and storm intensity.

## 2. BACKGROUND

The use of different convective parameterizations and of explicitly resolved convection significantly impacts the simulated track and intensity of tropical cyclones (e.g., Davis and Bosart 2002). Even the choice of CP used on coarser, outer grids affects the explicitly resolved convection on the finer-mesh grids for which they provide lateral boundary conditions. In their three-domain case study of summer convection in the southwestern U.S., Warner and Hsu (2000) concluded that mass field adjustments on the outer grids affect the timing and intensity of precipitation in the innermost finer grid, producing up to a factor of 3 difference in the 24-hour explicit precipitation totals. They proposed possible ways of mitigating this problem which included testing "the adequacy of marginal grid resolutions (3-5 km) for the explicit simulation of convection."

Weisman et al. (1997) simulated squall lines to test the sensitivity of horizontal grid resolution on explicit convection, using grid spacings between 1 and 12 km. This study concluded that 4 km grid spacing could reproduce essential features of the structure and evolution of the squall line seen in a 1 km run. Weisman et al. (1997, p. 546) speculate that this minimal resolution may be smaller in tropical environments in order to resolve the weaker vertical motions found in tropical cyclones relative to that found in intense midlatitude convective systems. Bryan et al. (2003) recommend grid spacings on the order of 100 m to be used as a benchmark in resolution sensitivity studies in order to better represent intracloud motions.

## 3. METHODS

The Weather Research and Forecasting (WRF) model (Version 2.0.3.1) is used for five different forecasts, all of which used the same physics and grid specifications, except for the CP scheme. In all of the simulations, a one-way nested grid of three domains is used, with 27, 9, and 3 km grid spacing on the outermost to innermost domains, respectively (Fig. 1).

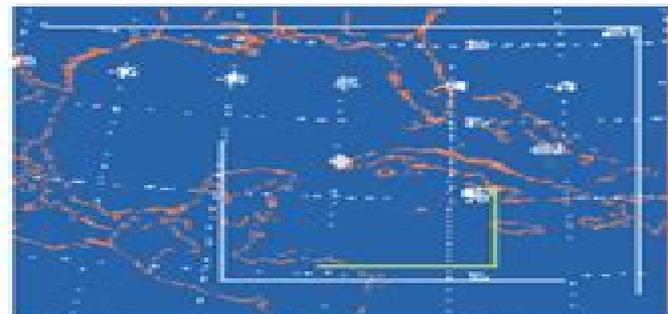

Fig. 1. Domain configuration used with grid spacing of 27, 9, and 3 km on domains 1, 2, and 3, respectively.
