A Primer on Scientific Programming with Python Hans Petter Langtangen, 2009-08-07

The aim of this book is to teach computer programming using examples from mathematics and the natural sciences We have chosen to use the Python programming language because it combines remarkable power with very clean simple and compact syntax Python is easy to learn and very well suited for an introduction to computer programming Python is also quite similar to Matlab and a good language for doing mathematical computing It is easy to combine Python with compiled languages like Fortran C and C which are widely used languages for scientific computations A seamless integration of Python with Java is offered by a special version of Python called Jython The examples in this book integrate programming with applications to mathematics physics biology and nanotechnology The reader is expected to have knowledge of basic one variable calculus as taught in mathematics intensive programs in high schools It is certainly an advantage to take a university calculus course in parallel preferably containing both classical and numerical aspects of calculus Although not strictly required a background in high school physics makes many of the examples more meaningful

Stock Market Prediction and Efficiency Analysis using Recurrent Neural Network Joish Bosco, Fateh Khan, 2018-09-18 Project Report from the year 2018 in the subject Computer Science Technical Computer Science course Computer Science language English abstract Modeling and Forecasting of the financial market have been an attractive topic to scholars and researchers from various academic fields The financial market is an abstract concept where financial commodities such as stocks bonds and precious metals transactions happen between buyers and sellers In the present scenario of the financial market world especially in the stock market forecasting the trend or the price of stocks using machine learning techniques and artificial neural networks are the most attractive issue to be investigated As Giles explained financial forecasting is an instance of signal processing problem which is difficult because of high noise small sample size non stationary and non linearity The noisy characteristics mean the incomplete information gap between past stock trading price and volume with a future price The stock market is sensitive with the political and macroeconomic environment However these two kinds of information are too complex and unstable to gather The above information that cannot be included in features are considered as noise The sample size of financial data is determined by real world transaction records On one hand a larger sample size refers a longer period of transaction records on the other hand large sample size increases the uncertainty of financial environment during the 2 sample period In this project we use stock data instead of daily data in order to reduce the probability of uncertain noise and relatively increase the sample size within a certain period of time By non stationarity one means that the distribution of stock data is various during time changing Non linearity implies that feature correlation of different individual stocks is various Efficient Market Hypothesis was developed by Burton G Malkiel in 1991
