Differences between Shunt Reactor and Power Transformer

Main Differences

Shunt Reactor and Transformer both appear *similar in construction*. Reactors are also often equipped with Fans for cooling similar to Power Transformers.

However, there are major differences between the two. While a [Power Transformer](#) is designed for efficient power transfer from one voltage system to another, a [shunt reactor](#) is intended *only to consume reactive VARs (or in other words it can be stated as to produce lagging VARs)*.

Thus, there are *more than one winding* on a Power Transformer with magnetic core which carry the mutual flux between the two. In reactor there is *just one winding*. The core is not therefore meant only to provide a low reluctance path for flux of that winding to increase the inductance.

In case of a Power Transformer, primary **Ampere-Turns (AT)** is sum of exciting AT and secondary AT. AT loss (in winding resistance, eddy loss and hysteric loss) is kept to as minimum as possible. Exciting AT is small compared with the secondary AT. Rated current is based on the load transfer requirement.
