Gilbert,David Epel,2009 It looks at examples where the environment provides expected cues for normal development and where the organism develops improperly without such cues Data from research on teratology endocrine disruptors and microbial symbioses when integrated into a developmental context may have enormous implications for human health as well as the overall health of Earth s ecosystems The study of epigenetics changes in gene expression that are not the result of changes in a gene s DNA sequence has recently provided startling insights not only into mechanisms of development but also into the mechanisms and processes of evolution The notion that epialleles changes in chromosome structure that alter gene expression can be induced by environmental agents and transmitted across generations has altered our notions of evolution as have new experiments documenting the genetic fixation of environmentally induced changes in development *Towards a Theory of Development* Alessandro Minelli,Thomas Pradeu,2014-05-01 Is it possible to explain and predict the development of living things What is development Articulate answers to these seemingly innocuous questions are far from straightforward To date no systematic targeted effort has been made to construct a unifying theory of development This novel work offers a unique exploration of the foundations of ontogeny by asking how the development of living things should be understood It explores the key concepts of developmental biology asks whether general principles of development can be discovered and examines the role of models and theories The two editors one a biologist with long interest in the theoretical aspects of his discipline the other a philosopher of science who has mainly worked on biological systems have assembled a team of leading contributors who are representative of the scientific and philosophical community within which a diversity of thoughts are growing and out of which a theory of development may eventually emerge They analyse a wealth of approaches to concepts models and theories of development such as gene regulatory networks accounts based on systems biology and on physics of soft matter the different articulations of evolution and development symbiont induced development as well as the widely discussed concepts of positional information and morphogenetic field the idea of a programme of development and its critiques and the long standing opposition between preformationist and epigenetic conceptions of development Towards a

development and the progress that was made at the turn of the century when they began to be studied on their own leading to new understandings of a variety of biological problems from evolution to cancer Investigating this story will help readers gain an appreciation of the historical development of scientific ideas It beautifully illustrates that the process of science is not as straightforward as it is usually portrayed One of the important lessons of this intriguing story is that facts do not necessarily speak for themselves and observations always need to be interpreted

Russian Journal of Developmental Biology, 2004 **On Human Nature**
Armin Grunwald, Matthias Gutmann, Eva M. Neumann-Held, 2013-04-17 Modern molecular technology in the so called life sciences biology as well as medicine allows today to approach and manipulate living beings in ways and to an extent which not too long ago seemed Utopian The empirical progress promises further and even more radical developments in the future and it is at least often claimed that this kind of research will have tremendous effects on and for all of humanity for example in the areas of food production transplantation medicine including stem cell research and xenotransplantation therapeutic genetic manipulation and cell line cloning of cell lines or tissues and of biodiversity conservation strategies At least in Western industrialized countries the development of modern sciences led to a steady increase of human health well being and quality of life However with the move to make the human body itself an object of scientific research interests the respective scientific descriptions resulted in changes in the image that human beings have of themselves Scientific progress has led to a startling loss of traditional human self understanding This development is in contrast to an understanding according to which the question what it means to be human is treated in the realm of philosophy And indeed a closer look reveals that without denying the value of scientific progress science cannot replace the philosophical approach to anthropological questions
