*Digital Image Processing* Rafael C. Gonzalez, Richard Eugene Woods, 2018 Introduce

your students to image processing with the industry's most prized text. For 40 years, *Image Processing* has been the foundational text for the study of digital image processing. The book is suited for students at the college senior and first-year graduate level with prior background in mathematical analysis, vectors, matrices, probability, statistics, linear systems, and computer programming. As in all earlier editions, the focus of this edition of the book is on fundamentals. The 4th Edition, which celebrates the book's 40th anniversary, is based on an extensive survey of faculty, students, and independent readers in 150 institutions from 30 countries. Their feedback led to expanded or new coverage of topics such as deep learning and deep neural networks, including convolutional neural networks, the scale-invariant feature transform (SIFT), maximally stable extremal regions (MSERs), graph cuts,  $k$ -means clustering, and superpixels; active contours, snakes, and level sets; and exact histogram matching. Major improvements were made in reorganizing the material on image transforms into a more cohesive presentation and in the discussion of spatial kernels and spatial filtering. Major revisions and additions were made to examples and homework exercises throughout the book. For the first time, we added MATLAB projects at the end of every chapter and compiled support packages for you and your teacher containing solutions, image databases, and sample code. The support materials for this title can be found at [www.ImageProcessingPlace.com](http://www.ImageProcessingPlace.com).

*Fundamentals of Digital Image Processing*, Chris Solomon, Toby Breckon, 2011-07-05. This is an introductory to intermediate-level text on the science of image processing, which employs the Matlab programming language to illustrate some of the elementary key concepts in modern image processing and pattern recognition. The approach taken is essentially practical, and the book offers a framework within which the concepts can be understood by a series of well-chosen examples, exercises, and computer experiments drawing on specific examples from within science, medicine, and engineering. Clearly divided into eleven distinct chapters, the book begins with a fast start introduction to image processing to enhance the accessibility of later topics. Subsequent chapters offer increasingly advanced discussion of topics involving more challenging concepts, with the final chapter looking at the application of automated image classification with Matlab examples. Matlab is frequently used in the book as a tool for demonstrations, conducting experiments, and for solving problems, as it is both ideally suited to this role and is widely available. Prior experience of Matlab is not required, and those without access to Matlab can still benefit from the independent presentation of topics and numerous examples. Features a companion website [www.wiley.com/go/solomon/fundamentals](http://www.wiley.com/go/solomon/fundamentals) containing a Matlab fast start primer, further exercises, examples, instructor resources, and accessibility to all files corresponding to the examples and exercises within the book itself. Includes numerous examples, graded exercises, and computer experiments to support both students and instructors alike.
