ABSTRACT

Main objective of this paper is to track the student in campus and enhance attendance monitoring system. The proposed system consists of RFID tag and reader. RFID readers would be installed at various locations in campus and also in classes. When student comes in the vicinity of reader then location can be found which will sends that location to server. A Student places the RFID card in the RFID card Reader. The RFID card Reader reads down the Student details. The Interface software is responsible to control the marking of attendance in the software. The system can also generate detention list of the students .It is small scale application which is completely automated, easy to control, time saving and reliable.

Keywords : Smart Grid, Smart Protection, Security, Smart Management, Smart Infrastructure

I. INTRODUCTION

Now a day there is high development in technology all the information is present on internet so if anyone want any information then it will easily available on internet. Because of this reason student are attracted towards various thing and they try to ignore study and they waste much more time. When student are entered in campus they try to avoid the lectures. Students are not ready to attend lectures and they are bunking lectures and parent assures that their son/daughter will present to lecture. But it is not happen in reality. So to avoid these things this system can be implemented. This system will track the student in the campus and also manages attendance of student. If student try to bunk the lecture and his/her attendance is below 70% then alert message will send to the parents.

System uses RFID technology to track the student. Radio frequency identification (RFID) is a technology that transmits data using radio waves from an RFID tag attached to an object by the reader for tracking and identifying objects [5]. RFID system contains two main components; the reader and the tags. The tag is normally attached to the objects to be monitored and

carries information in a microchip. The reader on the other hand detects tags that are within it frequency range and writes to or read from the tags [2].

1.1. The RFID Tag

The RFID tag is primarily is a kind of a memory device that can transmits its contents when being scanned by the reader. The memory consists of binary digits called the bits, and the transmission and receiving of data has a communication channel. The tag can be an electronic circuit with its own power supply (an active device) or a very low power integrated circuit (passive device) which taps energy from the scanner to transmit its content. In a tag, the transmission power is very low and is measured in millionths of watt i.e. microwatts [1]. Tag can be passive, semi-passive or active. It can also be categorized based on memory type and based on the transmission channel. Passive RFID tags have no internal energy source; energy supplied to the antenna by the incoming radio frequency waves induced enough energy for the CMOS integrated circuit in the tag to get activated and transmits a response. The semi passive tag is similar to passive tag, but has an addition of small power source (battery). This battery
