

Designing a Qi-compliant receiver coil for wireless power systems, Part 1

By Bill Johns, Applications Engineer,
Tony Antonacci, System Engineer,
and Kalyan Siddabattula, System Engineer

Overview

The implementation of the Wireless Power Consortium's (WPC's) Qi standard¹ brings wireless power to many different end applications. The receiver (Rx) coil for each application may have different geometries and/or power requirements. Since the Rx coil is a key component in a successful and efficient design of a Qi-compliant Rx and there are many design options and trade-offs to consider, the designer must take a careful and methodical approach when realizing a solution. This article provides the technical insight needed to realize a successful Rx-coil design. It covers the Qi-compliant system model as a basic transformer; Rx-coil measurements and system-level influences; and methods of qualifying a design for successful operation. It is assumed that the reader has a general understanding of the Qi-compliant inductive power system. Background information can be found in Reference 2.

Qi-compliant system as a transformer

For many near-field wireless power systems such as the one specified by the WPC, the behavior of the magnetic power transfer can be modeled by a simple transformer. A traditional transformer usually has a single physical structure with two windings around a core material that is highly permeable compared to air (Figure 1). Since the traditional transformer uses a highly permeable material to carry the magnetic flux, most (not all) of the flux produced by one coil couples to the second coil. This coupling, which can be measured through a parameter known as the coupling coefficient, is denoted as k (a measure that can have a value between 0 and 1).

Three parameters define a two-coil transformer:

L_{11} is the self-inductance of coil 1.

L_{22} is the self-inductance of coil 2.

L_{12} is the mutual inductance of coils 1 and 2.

The coefficient for coupling between the two coils can be formulated as

$$k = \frac{L_{12}}{\sqrt{L_{11}L_{22}}} \quad (1)$$

The ideal transformer then can be modeled by using a coupled inductor as shown in Figure 2.

Using the voltage and current relationship of an inductor can provide the nodal equations of this two-coil transformer:

$$V_1 = L_{11} \frac{di_1}{dt} + L_{12} \frac{di_2}{dt} \quad (2a)$$

Figure 1. Traditional transformer with one physical structure

Figure 2. Ideal model of a traditional transformer

Figure 3. Cantilever model of a traditional transformer

$$V_2 = L_{22} \frac{di_2}{dt} + L_{12} \frac{di_1}{dt} \quad (2b)$$

For circuit analysis, the model in Figure 2 can be represented by what traditionally is referred to as a cantilever model, shown in Figure 3. Here the magnetic coupling and mutual inductance are simplified to leakage and magnetizing inductances. This allows the physical nature of the
