Chapter 8 Solutions

8.1

```
function vec2int (vec5: bit_vector(4 downto 0))
  return integer is
  variable temp: integer := 0;
begin
  for i in 4 downto 0 loop
    if vec5(i) = '1' then temp := temp + 1; end if;
    if i /= 0 then temp := temp*2; end if;
  end loop;
  return temp;
end vec2int;
```

It will take 0 simulation time for the function to execute.

begin
  for i in 0 to N-1 loop
    if not firstone then
      if bit_vec(i) = '1' then
        firstone := true; end if;
        comp(i) := bit_vec(i);
      else

System Design with SystemCTM Thorsten Grötter, Stan Liao, Grant Martin, Stuart Swan, 2007-05-08 I am honored and delighted to write the foreword to this very first book about SystemC It is now an excellent time to summarize what SystemC really is and what it can be used for The main message in the area of design in the 2001 International Technology Roadmap for Semiconductors ITRS is that cost of design is the greatest threat to the continuation of the semiconductor roadmap This recent revision of the ITRS describes the major productivity improvements of the last few years as small block reuse large block reuse and IC implementation tools In order to continue to reduce design cost the required future solutions will be intelligent test benches and embedded system level methodology As the new system level specification and design language SystemC directly contributes to these two solutions These will have the biggest impact on future design technology and will reduce system implementation cost It took SystemC less than two years to emerge as the leader among the many new and well discussed system level design languages In my opinion this is due to the fact that SystemC adopted object oriented system level design the most promising method already applied by the majority of firms during the last couple of years Even before the introduction

of SystemC many system designers have attempted to develop executable specifications in C These executable functional specifications are then refined to the well known transaction level to model the communication of system level processes

López,Román Hermida,Walter Geisselhardt,2013-03-09 As electronic technology reaches the point where complex systems can be integrated on a single chip and higher degrees of performance can be achieved at lower costs designers must devise new ways to undertake the laborious task of coping with the numerous and non trivial problems that arise during the conception of such systems On the other hand shorter design cycles so that electronic products can fit into shrinking market windows put companies and consequently designers under pressure in a race to obtain reliable products in the minimum period of time New methodologies supported by automation and abstraction have appeared which have been crucial in making it possible for system designers to take over the traditional electronic design process and embedded systems is one of the fields that these methodologies are mainly targeting The inherent complexity of these systems with hardware and software components that usually execute concurrently and the very tight cost and performance constraints make them specially suitable to introduce higher levels of abstraction and automation so as to allow the designer to better tackle the many problems that appear during their design *Advanced Techniques for Embedded Systems Design and Test* is a comprehensive book presenting recent developments in methodologies and tools for the specification synthesis verification and test of embedded systems characterized by the use of high level languages as a road to productivity Each specific part of the design process from specification through to test is looked at with a constant emphasis on behavioral methodologies *Advanced Techniques for Embedded Systems Design and Test* is essential reading for all researchers in the design and test communities as well as system designers and CAD tools developers **Fundamentals of Logic Design** Charles H. Roth,Larry L.
