FUNCTIONAL EVALUATION: THE BARTHEL INDEX

A simple index of independence useful in scoring improvement in the rehabilitation of the chronically ill

Since 1955, the chronic disease hospitals in Maryland (Montebello State Hospital, Deer's Head Hospital, and Western Maryland Hospital) have been using a simple index of independence to score the ability of a patient with a neuro-muscular or musculoskeletal disorder to care for himself, and by repeating the test periodically, to assess his improvement. The Index (BI) has also been taught to many nurses, who have been helpful in evaluating patients prior to admission to these hospitals and after discharge.

FLORENCE I. MAHONEY, M.D.
AND
DOROTHEA W. BARTHEL, BA, PT

The values assigned to each item are based on time and amount of actual physical assistance required if a patient is unable to perform the activity. Full credit is not given for an activity if the patient needs even minimal help and/or supervision, i.e., if he cannot safely perform the activity without someone present in the room with him. Because of the time required to attend an incontinent patient and since he is not socially acceptable, continence was weighted heavily.

Environmental conditions may affect the patient's score. If he has special requirements (other than the usual home setting), his score will be lower when they are not met. Examples are: doorways wide enough for easy access by wheelchair; all rooms on the same level if he cannot walk; grab bars at the toilet and tub.

To be more valuable, an explanation of special environmental requirements should accompany the BI of each patient when these are indicated.

Each patient's BI is scored at the beginning of treatment in the Rehabilitation Service (PM&R), at intervals during the course of his rehabilitation, and at the time of maximum benefit. In this way, it is possible to determine how well and how rapidly he has progressed toward independence. Sometimes improvement does not show up because the presence of another person may still be required even though he does not actually give physical assistance. Usually lack of improvement in the BI after a reasonable period of treatment indicates poor potential for rehabilitation.

The American Journal of Occupational Therapy, 1996

Traumatic Brain Injury Rehabilitation M. Anne Chamberlain, V. Neumann, A. Tennant, 2013-12-11 In 1986 the Trustees of the Nuffield Provincial Hospitals Trust decided to develop a major core programme of studies concerned with the organization development and improvement of services for physically disabled and frail elderly people This programme developed rapidly due to the enthusiastic response of those in the field and by 1992 the total value of the programme was in excess of 2 million and currently totals over 3 2 million It comprised a cohesive matrix of grants commissioned throughout the United Kingdom for work in identified areas which taken in conjunction with existing grants formed a comprehensive programme of much needed studies and research in this field The whole was to be underpinned by a major study planned and financed by the Trust but conducted by the Royal College of Physicians to survey the existing services being provided by some 180 health authorities This study together with concern for the handicapped schoolleaver information about the availability of disability services and the care of mild moderate head injured persons formed the prime initial thrust of the programme In the case of head injury the Trust was particularly concerned that there was discontinuity of care for many

patients and little evidence as to which treatments were effective Once patients had stabilized in hospital they were discharged into the community under the care of their general practitioner often without a continuing responsibility from the hospital
