

# GEOPHYSICAL METHODS OF EXPLORATION

## CORE DRILLING

Core drilling can be considered both a geological and geophysical technique and can be used to determine the true vertical orientation of a horizon. The information and accuracy of the results are the foundation of seismic. Core drilling also provides the location of structural trap potential activities. Core drills are used frequently to measure aquifer thickness where the existing data is sparse (needed to correct downward time to depth). The two locations are determined and corrected by continuous and intermittent recording of formation logs (including geophysical and geologic data) during drilling. The information is the most significant and costly resource available throughout exploration since it is the only way to directly observe the earth.

## SEISMIC

Seismic techniques have recently had a major impact on the petroleum industry. They provide the most detailed and accurate information on the subsurface structure of the earth. Seismic techniques are used to determine the location and depth of structural traps. They are also used to determine the thickness and orientation of a horizon. ## MAGNETIC TECHNIQUES

The magnetic method of geophysical exploration is used to determine the location and depth of structural traps. It is based on the measurement of the earth's magnetic field. The magnetic field is affected by the presence of magnetic minerals in the earth's crust. These minerals are concentrated in certain areas, such as structural traps. ## ELECTRICAL TECHNIQUES

Electrical techniques of geophysical exploration are used to determine the location and depth of structural traps. They are based on the measurement of the earth's electrical resistivity. The electrical resistivity is affected by the presence of different rock types. These rock types are concentrated in certain areas, such as structural traps.
