

APES 2023 #1 (Set 2) FRQ-Aligned Multiple Choice Questions - KEY

1. Which response below would **NOT** earn the FRQ point?
- There was an average of 7-8 plant species found in technically restored piles
 - There was an average of 8 plant species found in technically restored piles 16-25 years after restoration.
 - The average number of species found in technically restored piles 16-25 years after restoration was 8.
 - 9 species

Reasoning: "Most students correctly identified the average number of species as "8" or "9." - Chief Reader Report

2. Which response below would **NOT** earn the FRQ point?
- As the age increased, the average numbers of species increased.
 - As more years passed, the number of plant species found in spontaneous restoration piles increased. The increase was steady, and about 2-4 new species were found every 5 years.
 - The average number of plant species in spontaneous piles slightly increases as the age increases.
 - As age increased, the number of plant species increased then decreased.

Reasoning: Most students were able to receive the point for this question using phrasing like 'increase/decrease, more, larger, etc.' When asked for a relationship, students should utilize words like increase, decrease, stay the same, etc.

3. Which responses below would earn the FRQ point? Select two.
- The hypothesis is correct because spontaneously restored areas support more plants, which can support more animal species.
 - Spontaneously restored piles have an increase in animal species over time because animals feed off of plants, so when the plant species increase, so do animal species, whereas since technically restored piles don't have as many plant species, they won't have as many animal species either.
 - This hypothesis is correct, after 35 years the average number of species in spontaneous piles was about double the number in technical piles. Technical restoration piles had an average of 8 species while spontaneous piles had 16-17 species.
 - I agree with the hypothesis because the spontaneous restoration piles contain a greater average of plant species which would increase biodiversity and attract more animals to those piles to use the plant as food sources. The technically restoration piles don't have as much plants, so as a result, it wouldn't attract as many animals.

Reasoning: When responding to this prompt, students needed to make a claim that there would be more animal species in the pile that had more plant diversity. Students made a couple common mistakes here - they wrote 'number of plants' or 'amount of plants' instead of noting number of plant species. Students also needed to create a connection between why greater plant species would create more animal species in that pile (ie: more plant biodiversity means more animal habitat, more food to eat, etc.).

4. Which response below would earn the FRQ point?
- A plant would have been small as it wouldn't have had time to grow into a bigger plant in the 1-5 years time span.
 - A plant found in a spontaneous restoration pile from years 1-5 would have been easily adaptable since it was so early on in the process.
 - An example of a characteristic would be that its roots wouldn't be strongly implanted in the ground due to its short time being there.
 - A plant species that could grow in the spontaneous restoration piles would be able to grow in full sunlight without shade.

Reasoning: Students were relatively successful with this question, they just needed to list a characteristic of a
