

Calorimetry Lab (aka: "Burn Lab")

https://www.youtube.com/watch?v=...

Introduction:

By measuring the heat that a chemical energy source or molecular bond is released as heat and light. The heat can be measured in some solid calories (7 calories equal 1000 Joules). Heat energy is used in the food industry. The more calories a food contains, the more heat energy it will provide. Foods high in calories will release large amounts of energy. One gram of a particular substance will release a certain amount of heat.

As calories is the amount of heat (energy) required to increase the temperature of 1 gram of water by 1°C. This process is the basis of the technique of calorimetry. In thermal investigation, you will use the method of calorimetry to approximate the amount of energy contained in a particular food unit or other food item. This heat goes off from the calorimeter as indicated by water that is evaporated above the burning food item. This method approximates the amount of heat given off by the food.

Purpose:

1. To determine how many calories of energy burning food items contain & compare to real number as indicated by the manufacturers?
2. Determine how this experiment can be improved to produce more accurate results.

Materials:

- | | | | |
|------------------------|------------|-------------------------|------------------|
| a. Test tubes & holder | b. Baggies | c. Thermometer or scale | d. matches |
| e. Copper-impaled | f. matches | g. Food items | h. 1 Paper clips |

Procedure:

1. Suspend your food item above the evaporating dish using 1 paper clip. The paper impaled (straddled) horizontally (around 1 inch) behind your dish (see your lab).
2. Measure the mass of the test tube with the copper-impaled paper clip set up above the evaporating dish as described.
3. Weigh 50mL of distilled water and pour it into the test tube. Record the mass of H₂O in the test tube (temperature = 1 mL of H₂O = 1 g).
4. Place the clip in the evaporating dish on the base of the ring stand. Light the test tube holder as that it will be directly above the clip. Check a thermometer for the initial and final temps.
5. Measure accurately the initial temperature of the water.
6. Alternatively, make the copper-impaled to sit under the test tube. Use a match to ignite the bottom of the clip and then put the burning clip back under the test tube. The idea is to get as much of the heat from the burning clip to ring stand base the water in the test tube.
7. Light the ring stand, etc. the water in the test tube with the clip burning. Measure the highest temperature of the water (temperature is in the test tube). No, light clip if it goes out.
8. Measure the final mass of the "clip" set in the evaporating dish of the burning (before data).
9. Repeat steps 1-7 using a different food item.
