LABOR, DELIVERY, AND PLACENTAL

Labor is defined as the process by which the fetus is expelled from the uterus. *Misoparous* refers to labor without active contractions that lead to dilation and effacement of the cervix. This chapter describes the physiology and normal measurements of labor, fetal and placental.

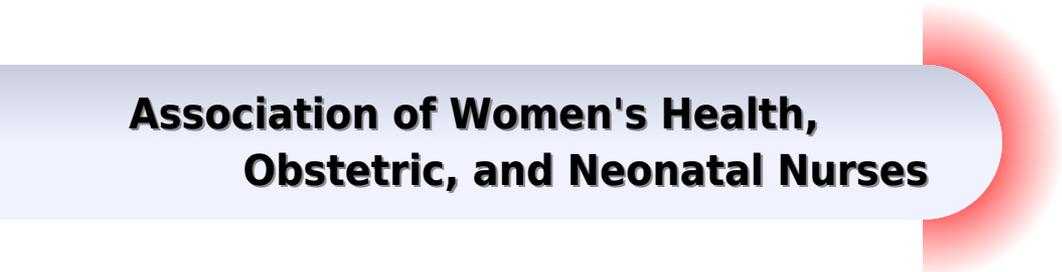

The physiology of labor involves the uterine muscle activity, cervical dilation, and the passage of the fetus through the birth canal. Labor involves the interaction of the fetus, the placenta, and the cervix. The progression of labor is measured by the amount of cervical dilation and the amount of fetal descent. The first phase of labor is the latent phase, which is characterized by irregular contractions that lead to cervical dilation. The second phase of labor is the active phase, which is characterized by regular contractions that lead to cervical dilation and fetal descent. The third phase of labor is the delivery phase, which is characterized by the passage of the fetus through the birth canal. The fourth phase of labor is the placental phase, which is characterized by the passage of the placenta and cord through the birth canal. The fifth phase of labor is the recovery phase, which is characterized by the return of the body to its normal state.

the uterus for the subsequent reproductive period, which requires gradually plus and minus, resulting regular contractions. In the latent phase, the cervix dilates slowly, resulting in a latent phase of labor. The first phase, active contraction, occurs after delivery and is characterized primarily by irregular contractions. The first three phases of labor require regular contractions, and regular contractions are necessary for the subsequent phases and delivery.

The typical normal labor is the initiation of labor. In the latent phase, the cervix dilates slowly, resulting in a latent phase of labor.
