## Chapter 1 Test Geometry:

Modeling of Beams and Arches Made from Processed Snow and Subjected to Static Loads James M. Watt, 1969 The report describes the modeling procedures and results of static loading of structural elements made of processed snow The general objective was to study the response of processed snow beams and arches to static loads and to formulate criteria that will make it possible to design processed snow structures to resist the airblast effects of nuclear explosions The primary objective was to determine the response and verify the adequacy of the modeling procedures for snow structures subjected to static loadings Author **WT-**, 1960 Series consists of individual technical reports Penetration Into Concrete of Gamma Radiation from Fallout W. F. Titus, 1960 The penetration into concrete of gamma radiation from fallout has been measured in an idealized geometry as a function of time after the detonation of a nuclear device At the same time the exposure dose rate in air at heights of 3 and 9 ft above the ground was measured with two detectors suspended from a tower and shielded from above with lead so as to be sensitive primarily to radiation from fallout on the ground For this test a sandwich made of seven concrete slabs forming a mass of concrete with face dimensions large enough to reduce edge effects to a negligible amount was buried with its top surface flush with the ground Remote reading detectors were placed between the concrete slabs thus permitting measurements of dose rate as a function of depth in concrete The concrete mass and the tower were located in the center of a cleared and leveled area approximately 200 yd in diameter Thus the gamma radiation at the detectors originated from an essentially infinite plane source of radiation Results are presented both as a function of time after detonation and of depth of penetration of the radiation into concrete A comparison of the results with theoretical calculations is made Author **Rheology of Fluid, Semisolid, and Solid Foods** M.
