The reason behind this endeavor is that there were almost no books available in the literature when we first started while there was and still is a real need to publish manuscripts summarizing the most useful ideas, concepts, results, and state of the art algorithms in this important area of research. According to all the feedback we have received so far we can say that we were right in doing this. Recently several other researchers have followed us in this journey and have published interesting books with their own visions and perspectives. The idea of writing a book on Microphone Array Signal Processing comes from discussions we have had with many colleagues and friends. As a consequence of these discussions we came up with the conclusion that again there is an urgent need for a monograph that carefully explains the theory and implementation of microphone arrays. While there are many manuscripts on antenna arrays from a narrowband perspective, narrowband signals, and narrowband processing, the literature is quite scarce when it comes to sensor arrays explained from a truly broadband perspective. Many algorithms for speech applications were simply borrowed from narrowband antenna arrays. However, a direct application of narrowband ideas to broadband speech processing may not be necessarily appropriate and can lead to many misunderstandings. **The Digital Signal Processing Handbook** VIJAY MADISETTI, 1997-12-29 The field of digital signal processing (DSP) has spurred developments from basic theory of discrete time signals and processing tools to diverse applications in telecommunications, speech, and acoustics, radar, and video. This volume provides an accessible reference offering theoretical and practical information to the audience of DSP users. This immense compilation outlines both introductory and specialized aspects of information bearing signals in digital form, creating a resource relevant to the expanding needs of the engineering community. It also explores the use of computers and special purpose digital hardware in extracting information or transforming signals in advantageous ways. Impacted areas presented include Telecommunications, Computer engineering, Acoustics, Seismic data analysis, DSP software and hardware.
