*Advanced PIC Microcontroller Projects in C* Dogan Ibrahim, 2011-08-30 This book is ideal for the engineer technician hobbyist and student who have knowledge of the basic principles of PIC microcontrollers and want to develop more advanced applications using the 18F series The architecture of the PIC 18FXXX series as well as typical oscillator reset memory and input output circuits is completely detailed After giving an introduction to programming in C the book describes the project development cycle in full giving details of the process of editing compilation error handling programming and the use of specific development tools The bulk of the book gives full details of tried and tested hands on projects such as the 12C BUS USB BUS CAN BUS SPI BUS and real time operating systems A clear introduction to the PIC 18FXXX microcontroller s architecture 20 projects including developing wireless and sensor network applications using I2C BUS USB BUS CAN BUS and the SPI BUS which give the block and circuit diagram program description in PDL program listing and program description Numerous examples of using developmental tools simulators in circuit debuggers especially ICD2 and emulators

*VLISP A Verified Implementation of Scheme* Joshua D. Guttman, Mitchell Wand, 2012-12-06 The VLISP project showed how to produce a comprehensively verified implementation for a programming language namely Scheme 4 15 Some of the major elements in this verification were The proof was based on the Clinger Rees denotational semantics of Scheme given in 15 Our goal was to produce a warts and all verification of a real language With very few exceptions we constrained ourselves to use the semantic specification as published The verification was intended to be rigorous but not completely formal much in the style of ordinary mathematical discourse Our goal was to verify the algorithms and data types used in the implementation not their embodiment in code See Section 2 for a more complete discussion of these issues Our decision to be faithful to the published semantic specification led to the most difficult portions of the proofs these are discussed in 13 Section 2 3 2 4 Our implementation was based on the Scheme48 implementation of Kelsey and Rees 17 This implementation translates Scheme into an intermediate level byte code language which is interpreted by a virtual machine The virtual machine is written in a subset of Scheme called PreScheme The implementation is sufficiently complete and efficient to allow it to bootstrap itself We believe that this is the first verified language implementation with these properties
