Coastal Engineering Processes Theory And Design Practice:

Coastal Engineering Dominic Reeve, Andrew Chadwick, Christopher Fleming, 2004-09-16 The United Nations estimate that by 2004 in excess of 75% of the world's population will live within the coastal zone. These regions are therefore of critical importance to a majority of the world's citizens. The coastal zone provides important economic, transport, residential, and recreational functions, all of which depend upon its physical characteristics, appealing landscape, cultural heritage, natural resources, and rich marine and terrestrial biodiversity. This resource is thus the foundation for the well-being and economic viability of present and future generations of coastal zone residents. The pressure on coastal environments is also being exacerbated by rapid changes in global climate. The value of the coastal zone to humanity and the enormous pressure on it provide strong incentives for a greater scientific understanding which can ensure effective coastal engineering practice and efficient and sustainable management. *Coastal Engineering Processes Theory and Design Practice* is the only book providing a thorough introduction to all aspects of coastal processes, morphology, and design of coastal defences. The use of detailed and state-of-the-art modelling techniques are an important theme of this book, and there are numerous case studies showing actual examples where mathematical modelling has been applied through engineering judgement. With thorough coverage of the theory and practical demonstration of the applications, *Coastal Engineering Processes Theory and Design Practice* is a must-have for all students and engineers working in coastal management and engineering.

Coastal Engineering Dominic Reeve, Andrew Chadwick, Christopher Fleming, 2018-03-09 Effective coastal engineering is expensive, but it is not as costly as neglect or ineffective intervention. Good practice needs to be based on sound principles, but theoretical work and modelling also need to be well-grounded in practice, which is continuously evolving. Conceptual and detailed design has been advanced by new industry publications since the publication of the second edition. This third edition provides a number of updates: the sections on wave overtopping have been updated to reflect changes brought in with the recently issued EurOtop II manual; a detailed worked example is given of the calculation of extreme wave conditions for design; additional examples have been included on the reliability of structures and probabilistic design; the method for tidal analysis and calculation of amplitudes and phases of harmonic constituents from water level time series has been introduced in a new appendix, together with a worked example of harmonic analysis; and a real-life example is included of a design adapting to climate change. This book is especially useful as an information source for undergraduates and engineering MSc students specializing in coastal engineering and management. Readers require a good grounding in basic fluid mechanics or engineering hydraulics and some familiarity with elementary statistical concepts.
