

Speed and Experiments

Speed

Speed is distance over time. It is the amount of distance traveled in a certain amount of time. The standard units are meters per second, but we use miles per hour when talking about cars.

$\text{Speed} = \frac{\text{Distance}}{\text{Time}}$

$\text{Speed} \times \text{Time} = \text{Distance}$

$\text{Distance} \div \text{Speed} = \text{Time}$

As you can see, when the distance is a given, all you need is time to find the speed. But to find the time you need to know the distance and the speed.

A given time (1000 seconds) is given. Calculate the object's speed.		A given distance (1000 meters) is given. Calculate the object's speed.		A given time (1000 seconds) is given. Calculate the distance traveled.

Experiments

Experiments are used to test a hypothesis or to discover a hypothesis.

If experiments are going well, you can learn a lot about the world around you. What are some things you can learn about the world?

Note

A hypothesis is a testable prediction.

Good experiments have several parts. Why? Because to really prove a hypothesis, you need to control the variables. This means changing one variable at a time and seeing what happens. This is called a controlled experiment.

A Data Table

This data table is an example of a data table.

Time	Time (min)
1	1.5
2	2
3	2.5
4	3
5	3.5
Average	2.5

Check that the data makes sense. What does it tell you?

Are there any patterns in the data?

Remember

A hypothesis is a testable prediction.

Good experiments have several parts. Why? Because to really prove a hypothesis, you need to control the variables. This means changing one variable at a time and seeing what happens. This is called a controlled experiment.

Can static type systems speed up programming? An experimental evaluation of static and dynamic type systems

Sebastian Kleinschmager, 2012-08-14 Master's Thesis from the year 2011 in the subject Computer Science Software grade 1
0 University of Duisburg Essen Institute for Computer Science and Business Information Systems course Informatik
Empirische Softwareforschung language English abstract Type systems of programming languages are a much discussed
topic of software engineering There are many voices arguing towards static as well as dynamic type systems although their
actual impact on software development is rarely evaluated using rigorous scientific methods In the context of this work a
controlled experiment with 36 participants was conducted which tried to compare the performance of software developers
using a static and a dynamic type system for the same tasks using an undocumented API The two programming languages
used were Java and Groovy The experiment and its results are analyzed and discussed in this thesis Its main hypothesis was
that a static type system speeds up the time developers need to solve programming tasks in an undocumented API The main
results of the experiment speak strongly in favor of this hypothesis because the static type system seems to have a
significantly positive impact on the development time
