Relational Database Interview Questions

What is a relational database?

A relational database is a type of database that organizes data into one or more tables, with each table consisting of a set of rows and columns. The tables are related to one another through the use of a key, allowing for easy data retrieval and manipulation.

What is the purpose of a primary key in a relational database?

A primary key is a unique identifier for each row in a table. It is used to enforce the integrity of the data by ensuring that each row has a unique value, and it is also used to establish relationships with other tables through foreign keys.

What is normalization in a relational database?

Normalization is the process of organizing data in a database into separate tables based on their logical relationships. The goal of normalization is to minimize data redundancy and improve data integrity by ensuring that each piece of data is stored in only one place.
