Chemometrics Research Alexey L. Pomerantsev, 2005 Chemometrics is the chemical discipline that uses mathematical statistical and other methods employing formal logic to design or select optimal measurement procedures and experiments and to provide maximum relevant chemical information by analysing chemical data Being conceived as a branch of analytical chemistry chemometrics now is a general approach It extracts relevant information out of measured data regardless of their origin chemical physical biological etc Chemometrics has been applied in different areas and most successfully in multivariate calibration pattern recognition classification and discriminant analysis multivariate modelling and monitoring of processes The main chemometric principle is a concept of hidden data structures that can be found using methods of multivariate data analysis These are the well known statistic tools such as partial least squares PLS soft independent modelling of class analogy SIMCA principal component regression PCR wavelet analysis and many others Current activities of chemometricians fall into two main categories 1 development of new methods for manipulating multivariate data and 2 new applications of the known chemometric techniques in different areas such as environment control food industry agriculture medicine and engineering
