Implementation of Image Compression Algorithm Using Verilog with Area, Power and Timing Constraints ,

Image compression is the application of Data compression on digital images A fundamental shift in the image compression approach came after the Discrete Wavelet Transform DWT became popular To overcome the inefficiencies in the JPEG standard and serve emerging areas of mobile and Internet communications the new JPEG2000 standard has been developed based on the principles of DWT An image compression algorithm was comprehended using Matlab code and modified to perform better when implemented in hardware description language Using Verilog HDL the encoder for the image compression employing DWT was implemented Detailed analysis for power timing and area was done for Booth multiplier which forms the major building block in implementing DWT The encoding technique exploits the zero tree structure present in the bitplanes to compress the transform coefficients

Digital Image Compression Techniques

Majid Rabbani,Paul W. Jones,1991

In order to utilize digital images effectively specific techniques are needed to reduce the number of bits required for their representation This Tutorial Text provides the groundwork for understanding these image compression techniques and presents a number of different schemes that have proven useful The algorithms discussed in this book are concerned mainly with the compression of still frame continuous tone monochrome and color images but some of the techniques such as arithmetic coding have found widespread use in the compression of bilevel images Both lossless bit preserving and lossy techniques are considered A detailed description of the compression algorithm proposed as the world standard the JPEG baseline algorithm is provided The book contains approximately 30 pages of reconstructed and error images illustrating the effect of each compression technique on a consistent image set thus allowing for a direct comparison of bit rates and reconstructed image quality For each algorithm issues such as quality vs bit rate implementation complexity and susceptibility to channel errors are considered

Still Image Compression on Parallel Computer Architectures Savitri Bevinakoppa,1998-11-30

Still

Image Compression on Parallel Computer Architectures investigates the application of parallel processing techniques to digital image compression. Digital image compression is used to reduce the number of bits required to store an image in computer memory and or transmit it over a communication link. Over the past decade advancements in technology have spawned many applications of digital imaging such as photo videotex desktop publishing graphics arts color facsimile newspaper wire phototransmission and medical imaging. For many other contemporary applications such as distributed multimedia systems rapid transmission of images is necessary. Dollar cost as well as time cost of transmission and storage tend to be directly proportional to the volume of data. Therefore application of digital image compression techniques becomes necessary to minimize costs. A number of digital image compression algorithms have been developed and standardized. With the success of these algorithms research effort is now directed towards improving implementation techniques. The Joint Photographic Experts Group JPEG and Motion Photographic Experts Group MPEG are international organizations which have developed digital image compression standards. Hardware VLSI chips which implement the JPEG image compression algorithm are available. Such hardware is specific to image compression only and cannot be used for other image processing applications. A flexible means of implementing digital image compression algorithms is still required. An obvious method of processing different imaging applications on general purpose hardware platforms is to develop software implementations. JPEG uses an 8 x 8 block of image samples as the basic element for compression. These blocks are processed sequentially. There is always the possibility of having similar blocks in a given image. If similar blocks in an image are located then repeated compression of these blocks is not necessary. By locating similar blocks in the image the speed of compression can be increased and the size of the compressed image can be reduced. Based on this concept an enhancement to the JPEG algorithm is proposed called Block Comparator Technique BCT. Still Image Compression on Parallel Computer Architectures is designed for advanced students and practitioners of computer science. This comprehensive reference provides a foundation for understanding digital image compression techniques and parallel computer architectures. Digital Image Compression Weidong Kou, 2013-03-14. Digital image business applications are expanding rapidly driven by recent advances in the technology and breakthroughs in the price and performance of hardware and firmware. This ever increasing need for the storage and transmission of images has in turn driven the technology of image compression. Image data rate reduction to save storage space and reduce transmission rate requirements. Digital image compression offers a solution to a variety of imaging applications that require a vast amount of data to represent the images such as document imaging management systems facsimile transmission image archiving remote sensing medical imaging entertainment HDTV broadcasting education and video teleconferencing. Digital Image Compression Algorithms and Standards introduces the reader to compression algorithms including the CCITT facsimile standards T 4 and T 6 JBIG CCITT H 261 and MPEG standards. The book provides comprehensive explanations of the principles and concepts of the algorithms helping the readers.

understanding and allowing them to use the standards in business product development and R D Audience A valuable reference for the graduate student researcher and engineer May also be used as a text for a course on the subject

Implementation of a Polyline Image Compression Algorithm Using Parallel Architectures D.P. Richards,1990

Hardware Implementation of a JPEG-LS Codec Michael Piorun,2001 The primary goal of this thesis is to implement a hardware version of the JPEG LS or JPEGLossless image compression algorithm in VHDL The JPEG LS algorithm is currently the designated standard for lossless compression of grayscale and color images by the JPEG committee Although lossy image compression is widely used when dealing with grayscale images there are some applications that require lossless image compression so that the original image may be recovered This is often the case for historical and legal document image archives medical and satellite imagery and biometric images The JPEG LS algorithm is much less complex than other current lossless image compression algorithms and offers similar or better compression gains Near lossless compression offers higher compression gains by using a pixel tolerance specified by the user The algorithm uses a predictive technique for compression and the resulting prediction error is encoded not the pixel value itself This prediction error is encoded with Golomb Rice coding which is optimal for a geometric distribution such as prediction error The predictor enters a special run length mode to encode pixels with identical values in lossless mode or nearly identical values within a known value in near lossless mode which maximizes compression further In this thesis the JPEG LS algorithm is implemented in C VHDL and further synthesized using the Synopsys synthesis tool suite Pictorial document medical remote sensing and biometric images are used for testing the project against another standard compliant software implementation The compression ratio for lossless compression is approximately 2 and is greater for near lossless compression The end result is a Synopsys schematic that represents a JPEG LS codec which is capable of lossless and near lossless encoding and decoding Performance characteristics such as chip area speed and power consumption are extracted from the synthesis tool These are approximately 375 000 gates a 15 ns clock cycle and 59 mW respectively A hardware implementation of this algorithm on an FPGA or ASIC would give a digital camera or scanner an edge in the marketplace Abstract **Telemedicine: The**
