Abstract

In this paper, we consider fuzzy stochastic differential equations (FSDEs) driven by fractional Brownian motion (fBm). These equations can be applied in hybrid real-world systems, including randomness, fuzziness and long-range dependence. Under some assumptions on the coefficients, we follow an approximation method to the fractional stochastic integral to study the existence and uniqueness of the solutions. As an example, in financial models, we obtain the solution for an equation with linear coefficients.

Keywords: Fuzzy set theory; Fuzzy stochastic processes; Fuzzy stochastic differential equation; Fractional Brownian motion

1 Introduction

The FSDEs are used in real-world systems that the phenomena are related to randomness and fuzziness as two kinds of uncertainties, such as in economics and finance. There are papers on FSDEs that each one is different from the others in the approach. The author in [9] presented a definition of the fuzzy stochastic Itô integral. In [12–15] the author used the fuzzy non-anticipating stochastic processes and Wiener process to drive the fuzzy Itô stochastic integral. The method deals with the embedding of a crisp Itô stochastic integral into fuzzy space to build a fuzzy random variable.

On the other hand, in the modeling of many stochastic systems, the fBm which shows a long-range dependence, is suggested to replace the Brownian motion as the driving process. The fBm with $H \in (0, 1)$ as Hurst parameter is a Gaussian process with beneficial properties, long-range dependence, self-similarity and stationary of increments. This process is appropriate for the analysis of phenomena which present long-range and scale-invariant correlations. Nevertheless, when $H \neq \frac{1}{2}$, the fBm is not a semimartingale.

In this paper, we introduce FSDEs with respect to the fBm. These equations can be helpful in the modeling of hybrid dynamic systems, including randomness, fuzziness and long-range dependence. We apply an approximation procedure to fractional stochastic integral to find the explicit solutions. We consider the Liouville form of the fBm with parameter $H \in (\frac{1}{2}, 1)$ to study the existence and uniqueness of strong solutions. Moreover, we consider an application of the equations in financial models.

Oksendal, 2013-03-09 These notes are based on a postgraduate course I gave on stochastic differential equations at Edinburgh University in the spring 1982. No previous knowledge about the subject was assumed but the presentation is based on some background in measure theory. There are several reasons why one should learn more about stochastic differential equations. They have a wide range of applications outside mathematics; there are many fruitful connections to other mathematical disciplines and the subject has a rapidly developing life of its own as a fascinating research field with many interesting unanswered questions. Unfortunately, most of the literature about stochastic differential equations seems to place so much emphasis on rigor and completeness that it scares many nonexperts away. These notes are an attempt to approach the subject from the nonexpert point of view. Not knowing anything except rumours, maybe about a subject to start with, what would I like to know first of all? My answer would be:

1. In what situations does the subject arise?
2. What are its essential features?
3. What are the applications and the connections to other fields?

I would not be so interested in the proof of the most general case but rather in an easier proof of a special case which may give just as much of the basic idea in the argument. And I would be willing to believe some basic results without proof at first stage anyway in order to have time for some more basic applications.
