Email forensic tools: A roadmap to email header analysis through a cybercrime use case

Keywords

email forensics, cybercrime, digital forensic tools, digital crime

Abstract

Email is one of the primary sources of numerous criminal activities, on the Internet, of which some threaten human lives. Email analysis is challenging due to not only various fields that can be forged by hackers or the wide range email applications in use, but also due to imposed law restrictions in the analysis of email body. Despite this being a relatively new area, a number of both open source and proprietary forensic tools, with varying possibilities and versatility, have been developed aiding use by practitioners. In this paper, we review existing email forensic tools for email header analysis, as part of email investigation, with emphasis on aspects related to online crime while still considering legal constraints. Through our analysis, we investigate a common case of cybercrime and examine the breadth of information one may gain solely through email forensics analysis. Additionally, a roadmap for email forensic analysis is presented, combining features and functionality already available, to assist the process of digital forensic analysis.

1. Introduction

We span the information age where information is maintained in digital form aiding improved efficiency and productivity [34]. The internet is a network of networks, connecting millions of computing devices [24] performing information interchange throughout the world; producing a large amount of electronic messages. As a result, e-mail has emerged as the most important application on Internet for communication of information, used not only from computers but many other electronic gadgets. Royal Pingdom, which monitors the Internet usage, stated that in 2010, 107 trillion e-mails were sent; that is 294 billion e-mails sent per day [21].

The heavy exchange of electronic messages coupled with the right of anonymity, result in increased number of criminal and terrorism activity [27]

mainly due to two inherent limitations [12]. There is rarely any encryption at the sender end and/or integrity checks at the recipient end, while the widely used e-mail protocol SMTP (Simple Mail Transfer Protocol) lacks a source authentication mechanism. Although there have been many attempts into securing e-mail systems, most are still inadequately secured. Installing antiviruses, filters, firewalls and scanners is simply not enough to secure e-mail communications.

Some common examples of illegitimate uses of emails are spam, phishing, cyber bullying, racial abuse, disclosure of confidential information, child pornography and sexual harassment. In the vast majority of these e-mail cybercrimes the tactics used vary from simple anonymity to impersonation and identity theft. Therefore, a forensic investigator needs efficient tools and techniques to perform the

Email Forensics Crow Security, 2022-04-20 Email Communication first evolved in the 1960s and since then emails are being used as the primary communication mode in enterprises for business communication Today a mass number of internet users are dependent on emails to receive information and deals from their service providers The growing dependence on email for daily communication given raise to email crimes Cybercriminals are now using email to target innocent users to lure them with attractive deals via spam emails Therefore forensic investigators need to have a thorough understanding of an email system and different techniques used by cyber criminals to conduct email crimes Email forensics refers to the study of the source and content of emails as evidence to spot the actual sender and recipient of a message data time and intent of the sender In this module of the computer forensics investigation series we will learn various steps involved in the investigation of email crime We will learn to investigate the meta data of malicious emails You will understand port scanning keyword searching and analysis of headers in emails Here

the primary goal for a forensics investigator is to find the person behind the email crime Hence he has to investigate the server of the email network devices software and fingerprints of the sender mailer Further we will understand various components involved in email communication We will learn about mail user agents mail transfer agents and various protocols used to send emails As we know an email system works on the basic client server architecture that allows clients to send and receive emails An email client software helps the sender to compose the mail Most of them have a text editor which helps the sender to compose the email for the receiver Here while composing emails malicious people embed malicious scripts and attach malware and viruses which are then sent to people The goal of this ebook is not to help you set up an email server rather we will focus on understanding the basic functionality of the email server We will understand what components an email system consists of which allows users to send and receive emails Furthermore we will dive deeper into the forensics part to investigate and discover evidence We will understand the investigation procedure for email crimes

Investigating and Implementing an Email Forensic Readiness Architecture Franscois Ruan Van Staden,2017 Email forensic investigations rely on the collection and analysis of digital forensic evidence collected from email systems Problems arise when the digital forensic evidence needed for the email forensic investigation is no longer available or there is a huge amount of email data that can be collected which take time to sift through to find the digital forensic evidence that is actually needed The email digital forensic readiness eDFR architecture as proposed in this dissertation endeavours to address these problems The eDFR architecture is based on the digital forensic readiness process described in ISO 27043 To ensure that the collected email data can be used as digital forensic evidence a process to validate the collected email data was created The validation process uses data collected from the email IP headers to validate the data in the SMTP headers ensuring that the SMTP header data was not spoofed or in any way changed The IP header data is stored in an audit database together with the email data so that the validation process can be executed at any time An audit database is used to store the collected data to ensure that once the data is stored it cannot be tampered with The digital forensic evidence collected using the eDFR architecture was found to be useable as part of an email forensic investigation It was also found to be useful for other processes such as creating a graph representation of email sent and received by an email system or a group of email systems It was shown that implementing the eDFR architecture could be achieved in an economical way that has almost no impact on current email systems

Paglierani,2013 The digital forensics community has neglected email forensics as a process despite the fact that email remains an important tool in the commission of crime Current forensic practices focus mostly on that of disk forensics while email forensics is left as an analysis task stemming from that practice As there is no well defined process to be used for email forensics the comprehensiveness extensibility of tools uniformity of evidence usefulness in collaborative distributed environments and consistency of investigations are hindered At present there exists little support for discovering acquiring and representing web based email despite its widespread use To remedy this a systematic process which includes discovering acquiring and representing web based email for email forensics which is integrated into the normal forensic analysis workflow and which accommodates the distinct characteristics of email evidence

will be presented This process focuses on detecting the presence of non obvious artifacts related to email accounts retrieving the data from the service provider and representing email in a well structured format based on existing standards As a result developers and organizations can collaboratively create and use analysis tools that can analyze email evidence from any source in the same fashion and the examiner can access additional data relevant to their forensic cases Following an extensible framework implementing this novel process driven approach has been implemented in an attempt to address the problems of comprehensiveness extensibility uniformity collaboration distribution and consistency within forensic investigations involving email evidence
