using C as reducing agent but also analysis of novel technologies using hydrogen This book will be a comprehensive guide to students and academics working with the latest techniques in process optimization at graduate level and above including some upper undergraduate researchers This book will also be very valuable for academics looking to teach or lecture in chemical process engineering This books will also be a very useful resource for anyone within the process industry to introduce the analysis of novel technologies as well as the modelling examples including recent software such as python gProms or even Excel or Matlab to solve reactor modelling and units operation but also process simulators applied to typical chemical processes Integrates principles of chemical engineering unit operations and chemical reactor engineering to understand process synthesis and analysis Includes historical perspectives and traces the improving efficiencies of commercially important chemical production processes Provides a systematic analysis of the processes building on thermodynamics kinetics mass and energy balances reactor engineering and unit operations Details different software packages to solve the examples from general purpose ones such as EXCEL or new ones like Python to specialized ones such as process simulators CHEMCAD or gProms Features worked examples and end of chapter problems with solutions to show the application of concepts discussed in the text

Nanostructured Materials for Next-Generation Energy Storage and Conversion Ying-Pin Chen,Sajid Bashir,Jingbo Louise Liu,2017-05-31 Volume 1 of a 4 volume series is a concise authoritative and an eminently readable and enjoyable experience related to hydrogen production storage and usage for portable and stationary power Although the major focus is on hydrogen discussion of fossil fuels and nuclear power is also presented where appropriate This monograph is written by recognized experts in the field and is both timely and appropriate as this decade will see application of hydrogen as an energy carrier for example in transportation sector The world s reliance on fossil fuels is due to the ever growing need for energy to sustain life and on going progress however exploitation also brings consequences such as emission of carbon nitrogen and sulfur dioxides into the atmosphere The collective influence of these photochemical gases is production of acid rain and an alternation of global temperatures leading to record high temperatures in many parts of the world The fossil fuel is unsustainable and thus there is a critical need for alternative sustainable energy resources One universal energy carrier is hydrogen which is the focus of this volume This book is suitable for those who work in the energy field as technical experts including engineers and scientists as well as managers policy and decision makers environmentalists and consultants Students and practitioners such as lectures teachers legislators and their aids in the field of energy will find this book invaluable and a practical handbook or guide in the field of sustainable energy with emphasis on hydrogen as an energy carrier
