Abstract: The critical infiltration pressures of the matrix in a two-dimensional (2D) carbon fiber preform were calculated theoretically, and the calculated values of the static and dynamic models were 0.115 and 0.478 MPa, respectively. Compared with the dynamic model, there is no viscous resistance or infiltration front gas pressure in the static model, so the static value is obviously lower than the dynamic value. To verify the rationality of theoretical calculation, 2D carbon fiber reinforced plastics (2D-CFRP) with infiltration pressures of 0.5, 0.6, 0.7, 0.8, and 0.9 MPa were prepared by the vacuum infiltration hot pressing molding process. The microstructure of the composite was observed and the bending strength was tested by three-point bending test. The results show that the infiltration pressure has an important influence on the infiltration effect and the bending fracture morphology. When the infiltration pressure is 0.7 MPa, the composite has an excellent infiltration effect. The fibers distribute reasonable in the fracture. Stress can be effectively transferred when the composite material is loaded. And the bending strength of the composite material reaches 627 MPa at this time.

1. Introduction

Carbon fiber reinforced resin matrix composite has a series of outstanding properties, such as low density, high specific strength, high specific modulus, chemical corrosion resistance, high thermal conductivity, and low thermal expansion coefficient [1,2]. It is widely used in aerospace, military, and automobile industries, electronics, and civil engineering [3,4]. The infiltration process is one of the most important steps in preparing 2D-CFRP by the vacuum infiltration hot pressing molding process. To prepare 2D-CFRP with excellent properties, the matrix needs be sufficiently and uniformly infiltrated in the 2D carbon fiber preform. Otherwise, there will be pores or local non-infiltration among the carbon fiber bundles, and carbon fibers cannot play the role of reinforcement effectively, which will greatly affect the microstructure and properties of 2D-CFRP [5]. The experimental results show that the infiltration effect of matrix in a 2D carbon fiber preform is partly determined by the infiltration pressure. If the infiltration pressure is too low, the matrix in the 2D carbon fiber preform is not sufficient and uniform. If the infiltration pressure is too high, the composite will produce cracks

Drylands under the Influence of Climate Change and Human Activities Zhiming Han, Mou Leong Tan, Jing Zhao, Xiaoping Wang, Song Feng, 2025-12-19 Covering over 40 percent of the Earth's land area and inhabited by more than 38 percent of the world's population drylands are very sensitive to climate change and human activities. These areas characterized by low soil fertility possess a heightened vulnerability to both climate warming and land degradation due mostly to human activities. Numerous studies have highlighted the expansion of drylands in the context of global warming. Therefore maintaining the ecological balance and ensuring sustainable economic development of the drylands are critical for the overall global environment and economy. The escalating drought exacerbated warming and rapid population growth are intensifying dryland expansion resulting in a multitude of potential risks such as reduced carbon sequestration regional warming land degradation and desertification. As environmentally sensitive and economically vulnerable areas the ecosystems and society in drylands will confront even more formidable challenges in a future warmer world with a rapidly growing population. Hence there is an urgent need for in depth exploration and understanding of the change in dryland regions and their underlying mechanisms. The objective of this Research Topic is to explore the change in drylands and the underlying mechanisms in the context of climate change and human activities. This endeavor will play a pivotal role in enhancing our comprehension and formulation of appropriate mitigation and adaptive strategies contributing to global stability and sustainable development. Contributions must improve our knowledge and understanding of dryland change processes and may include topics such as but not limited to the following: Climate change and dryland expansion; Hydroclimatic variability in drylands and their underlying physical mechanisms; Land air system interactions in drylands; Past and future changes of weather and climate extremes in drylands; Changes in water and energy balance and the driving forces; Modeling the water carbon cycle in dryland ecosystems; Response of dryland vegetation to climate change and human activities; Change in ecosystem patterns and enhancement of services in drylands; Biogeochemical cycles and fluxes e.g. carbon geochemistry and isotopes.
