

The Program

The Master of Science degree program in Geoinformatics offers opportunities for advanced study and research designed to prepare students for leading roles in industry, government, research and/or academic institutions. The educational objective of this program is to produce graduates who are capable of applying geospatial science and technology to solve problems in industry or academia as well as assuming a leadership role in their chosen employment field. This is a multidisciplinary program administered by the Department of Geological Sciences. It encompasses faculty and resources from the College of Sciences, College of Liberal and Fine Arts, College of Engineering, College of Public Policy, College of Architecture, Construction and Planning, as well as individual faculty from other academic departments.

MS in Geoinformatics

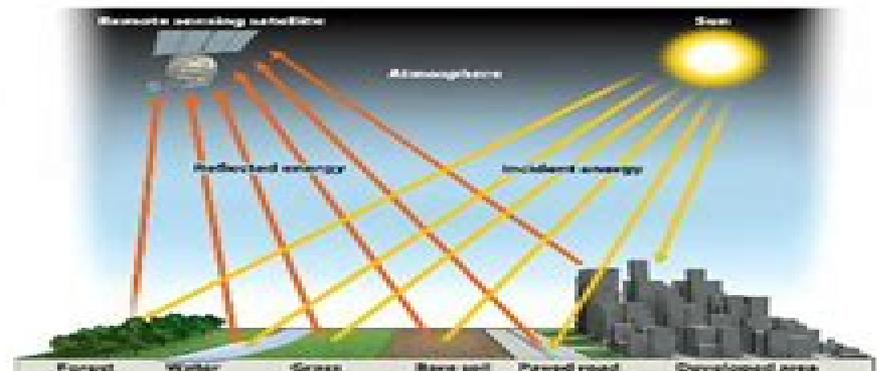

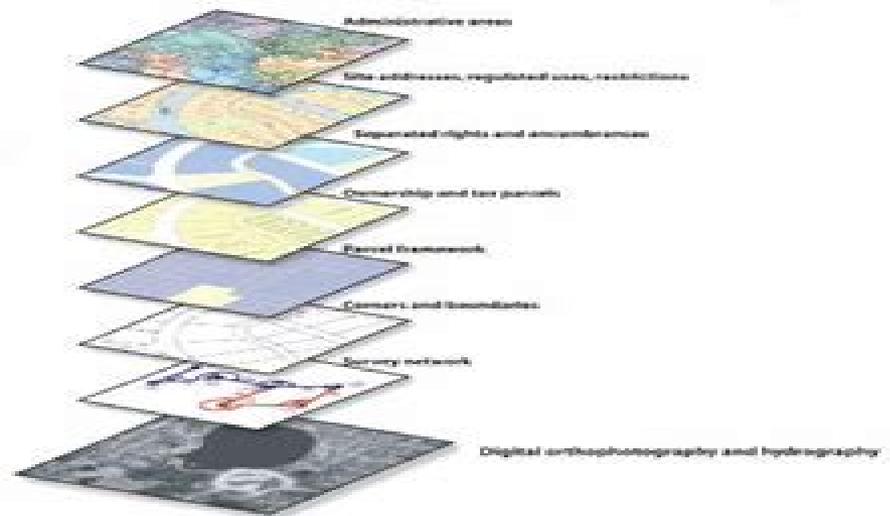

Research

The cross-disciplinary nature of the program utilizes spatial data (geographic and/or remote sensing data) to solve a real-life problems related to locations and changes in space and time, with wide applications in oil and gas industry, water resources and management, land use and land cover, climate change and cryosphere, archaeology, political science, urban planning and transportation, demography, public health, disaster response and relief effort, geospatial intelligence, and cyber-security.

Big data and cloud computing are the two new aspects of the program's collaborative research and applications, since geospatial and remote sensing data are big in nature and need advanced technology and methods for data mining, processing, storing, sharing, and distribution.

Facilities

The program has special laboratory facilities for geographic information systems, remote sensing, and field instruments: GPS, EM31, snow radar, terrestrial lidar, thermal infrared camera, ground penetrating radar, spectroradiometer, micro rain radar, rain gauge, and monitoring equipment for hydrological investigations.

Introduction to Natural and Man-made Disasters and Their Effects on Buildings Roxanna McDonald,2007-06-01 This is a comprehensive guide to all types of natural and man made disasters and their effect on buildings It gives overall guidance and a basic technical understanding of prevention mitigation and management of disaster and outlines a checklist of preventive design elements for each situation Every category is illustrated with a case study which pin points the essential information that is crucial to architects and engineers in designing buildings with disaster prevention in mind The aim of the book is to give a clear understanding of the nature of events and problems and to enable readers to respond with knowledge to the unique demands placed on their designs A special emphasis is also placed on re building as an opportunity to start again For the specialists this is a process of constant learning and improving techniques in the light of events past

Geospatial Analysis and Modelling of Urban Structure and Dynamics Bin Jiang,Xiaobai Yao,2010-06-16 A Coming of Age Geospatial Analysis and Modelling in the Early Twenty First Century Forty years ago when spatial analysis first emerged as a distinct theme within geography s quantitative revolution the focus was largely on consistent methods for measuring spatial correlation The concept of spatial au correlation took pride of place mirroring concerns in time series analysis about similar kinds of dependence known to distort the standard probability theory used to derive appropriate statistics Early applications of spatial correlation tended to reflect geographical patterns expressed as points The perspective taken on such analytical thinking was founded on induction the search for pattern in data with a view to suggesting appropriate hypotheses which could subsequently be tested In parallel but using very different techniques came the development of a more deductive style of analysis based on modelling and thence simulation Here the focus was on translating prior theory into forms for generating testable predictions whose outcomes could be compared with observations about some system or phenomenon of interest In the intervening years spatial analysis has broadened to embrace both inductive and deductive approaches often

combining both in different mixes for the variety of problems to which it is now applied

Expanding Boundaries: Systems Thinking in the Built Environment Guillaume Habert, Arno Schlueter, 2016-08-15 Consuming over 40% of total primary energy the built environment is in the centre of worldwide strategies and measures towards a more sustainable future To provide resilient solutions a simple optimisation of individual technologies will not be sufficient In contrast whole system thinking reveals and exploits connections between parts Each system interacts with others on different scales materials components buildings cities and domains ecology economy and social Whole system designers optimize the performance of such systems by understanding interconnections and identifying synergies The more complete the design integration the better the result In this book the reader will find the proceedings of the 2016 Sustainable Built Environment SBE Regional Conference in Zurich Papers have been written by academics and practitioners from all continents to bring forth the latest understanding on systems thinking in the built environment
