Trusted Platform Module Tpm Intel:

Trust Extension as a Mechanism for Secure Code Execution on Commodity Computers Bryan Jeffrey

Parno,2014-06-01 As society rushes to digitize sensitive information and services it is imperative to adopt adequate security protections However such protections fundamentally conflict with the benefits we expect from commodity computers In other words consumers and businesses value commodity computers because they provide good performance and an abundance of features at relatively low costs Meanwhile attempts to build secure systems from the ground up typically abandon such goals and hence are seldom adopted In this book I argue that we can resolve the tension between security and features by leveraging the trust a user has in one device to enable her to securely use another commodity device or service without sacrificing the performance and features expected of commodity systems At a high level we support this premise by developing techniques to allow a user to employ a small trusted portable device to securely learn what code is executing on her local computer Rather than entrusting her data to the mountain of buggy code likely running on her computer we construct an on demand secure execution environment which can perform security sensitive tasks and handle private data in complete isolation from all other software and most hardware on the system Meanwhile non security sensitive software retains the same abundance of features and performance it enjoys today Having established an environment for secure code execution on an individual computer we then show how to extend trust in this environment to network elements in a secure and efficient manner This allows us to reexamine the design of network protocols and defenses since we can now execute code on endhosts and trust the results within the network Lastly we extend the user s trust one more step to encompass computations performed on a remote host e g in the cloud We design analyze and prove secure a protocol that allows a user to outsource arbitrary computations to commodity computers run by an untrusted remote party or parties who may subject the computers to both software and hardware attacks Our protocol guarantees that the user can both verify that the results returned are indeed the correct results of the specified computations on the inputs provided and protect the secrecy of both the inputs and outputs of the computations These guarantees are provided in a non interactive asymptotically optimal with respect to CPU and bandwidth manner Thus extending a user s trust via software hardware and cryptographic techniques allows us to provide strong security protections for both local and remote computations on sensitive data while still preserving the performance and features of commodity computers

Trusted Computing Liqun Chen,Chris J. Mitchell,Andrew Martin,2009-03-26 This volume contains the 15 papers presented in the technical strand of the Trust 2009 conference held in Oxford UK in April 2009 Trust 2009 was the second international conference devoted to the technical and socio economic aspects of trusted computing The conference had two main strands one devoted to technical aspects of trusted computing addressed by these proceedings and the other devoted to socio economic aspects Trust 2009 built on the successful Trust 2008 conference held in Villach Austria in March 2008 The proceedings of Trust 2008 containing 14 papers

were published in volume 4968 of the Lecture Notes in Computer Science series

The technical strand of Trust 2009 contained 15 original papers on the design and application of trusted computing. For these proceedings, the papers have been divided into four main categories: namely, Implementation of trusted computing, Attestation, PKI for trusted computing, and Applications of trusted computing. The 15 papers included here were selected from a total of 33 submissions. The refereeing process was rigorous, involving at least three and mostly more independent reports being prepared for each submission. We are very grateful to our hard-working and distinguished Program Committee for doing such an excellent job in a timely fashion. We believe that the result is a high-quality set of papers, some of which have been significantly improved as a result of the refereeing process. We would also like to thank all the authors who submitted their papers to the technical strand of the Trust 2009 conference, all external referees, and all the attendees of the conference.
