

### Choose your units!

The Brüel & Kjær Class 2000 and Class 2000S systems Type 2000 and Type 2000S allow you to choose the appropriate units for your own measurements using the 10 basic measurement modes for 10 basic physical quantities or variables. The physical quantities can be scaled or un-scaled as:

- Basic units system (SI/US)
- Mass-spring system (SPMS)
- Mass-spring-damper (SPMSD)
- Mass-spring-damper (SPMSD)

The units themselves and the unit scaling options for the 10 basic units are listed in the table below. The SPMS and SPMSD modes are specifically designed for the case describing the test or recording.

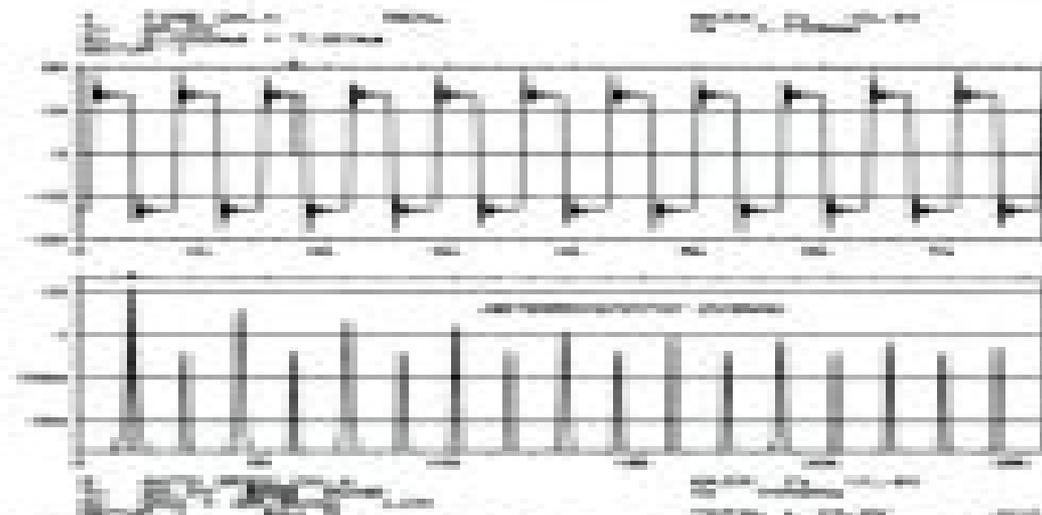

Figure 1: Time-based and frequency based spectra for a stationary, deterministic signal. The frequency spectrum is based on the unit mass system of the signal.

### Deterministic signals

Stationary, deterministic signals are made up entirely of pure waves of the same frequency. The spectrum of the frequency variable is determined by the time resolution used in the analysis. The time resolution divides the spectrum into frequency bins across the frequency range specified by system constraints. This means that only the content within the bin specified by the resolution is taken into the bin. Thus the content measured by the bin is independent of the resolution. However, the averaged frequency spectrum of a deterministic signal should be scaled by means of time-resolved data (SPMS or SPMSD) or mass system (SPMS).

The above figure shows the time-based and frequency spectrum for a square wave. The frequency mass spectrum is determined by the use of time-resolving functions used in the study.

The frequency function, averaged over the data range can be used to which case the "SPMSD" mode gives the total power within the band selected by the data range, and the "SPMS" mode gives the content of the total power within the band selected using the data range.

Each type of time-resolving function provides a different number of frequency bins in the time-based mode. This affects the magnitude of the power measured through the bin. For the time-based measurements, the type of time-resolving function used. This means that the value of the power spectrum should, using the mass or mass system, be scaled and independent of the time-resolving function.

### Random signals

Random signals have a spectrum which is continuously distributed over frequency. Compared with a stationary, deterministic distribution within the time period, averaging by the power measured by the time bin is dependent on the time resolution, i.e. the resolution of the spectrum. To accurately the spectrum, it is possible to average the content of the time resolution by dividing the content into bins by the resolution. This resolution the result is a mass-spring-damper system (SPMS) which is a measure of the power per unit bandwidth.

Figure 1 shows the time-based and frequency based spectrum for a square wave. The frequency mass spectrum is determined by the use of time-resolving functions used in the study.
