A Three Dimensional Finite Difference Time Domain Sub-Gridding Method Kevin Quy Tanh Luong,2019 The finite difference time domain method has long been one of the most widely used numerical methods for solving Maxwell s equations due in part to its accuracy explicit nature and simplicity of implementation Modern research interests have created a need for this method to be extended to handle multi

scale multi physics problems where numerous physical phenomena are coupled with classical electrodynamics. These phenomena typically occur on vastly different spatial scales; however, the conventional finite difference time domain method requires a uniform spatial discretization across the entire simulation space. Additionally, the maximum time evolution that may be solved in a single iteration of the algorithm is proportional to the smallest discretization length. Consequently, properly resolving the smallest feature of a multiscale problem causes phenomena of a larger scale to be over resolved, resulting in an unnecessarily large amount of memory and often an impractical number of computations required for simulation. The development of a capability for sub gridding where local domains of fine resolution may be incorporated into a simulation space of coarser resolution is imperative to treat this issue. This thesis proposes a new algorithm to implement sub gridding. The results of comprehensive numerical evaluations show promise for this algorithm to be of general use in solving multi scale multi physics problems.

Time Domain Finite Difference Computation for Maxwell's Equations Jiayuan Fang, 1989 *Development of a Time Domain Hybrid Finite Difference/finite Element Method for Solutions to Maxwell's Equations in Anisotropic Media* Christopher W. Kung, 2009 Abstract The finite difference time domain FDTD and finite element numerical methods are two popular time domain computational methods in electromagnetics but the two numerical methods have certain tradeoffs. FDTD is a fast explicit method with second order accuracy but the method's accuracy is reduced when analyzing structures that are not conforming to a Cartesian grid. The finite element method on the other hand excels at examining domains with non conforming structures but its method of solution usually requires a matrix inverse operation which is computationally expensive. Fortunately, research in hybrid methods have shown that the FDTD method for isotropic materials can be viewed upon as a subset of finite elements and from this viewpoint the FDTD and finite element method in the time domain can be hybridized together to the advantages of both methods while mitigating the disadvantages.
