

## Chapter 26 Physics Quiz

### Conceptual Questions

- 1. Prior to Einstein's description of the photoelectric effect... Explain why the existence of a frequency below which photoelectrons are not emitted favors.  
-Each photon can then produce a single photoelectron if the photon frequency is sufficiently high.
- 2. Describe how the number of photoelectrons emitted from a metal plate in the photoelectric effect would change if (a) the intensity of the incident radiation were increased, (b) the wavelength of the incident radiation were increased, and (c) the work function of the metal were increased.  
-hope she doesn't ask
- 3. Is it possible to observe photoelectrons emitted from a metal plate with relativistic speeds?  
-Yes, as long as the photon energy is high enough.
- 4. Consider the photoelectric emission of electrons induced by incident light of a single wavelength. The incoming photons all have the same energy, but the emitted electrons have a range of kinetic energies. Why?  
- Based on the assumption light traveled purely as a wave through space .
- 5. A markedly nonclassical feature of the photoelectric effect is that the energy of the emitted electrons doesn't increase as you increase the intensity of the light striking the metal surface. What change does occur as the intensity is increased?  
-Increasing the intensity means delivering photons to the surface of the metal at a greater rate: the photocurrent rate increases.
- 6. How does the intensity of light from a blackbody change when its temperature is increased? What changes occur in the body's radiation spectrum?
- 7. The Compton effect is practically unobservable for visible light. Why?  
-Light can Compton scatter. The change in the wavelength is negligibly small.
