Researchers may find themselves confronted with proteases either because they play an essential role in a particular process they are studying or because they interfere with that process. In either case they may need to investigate or inhibit the proteolytic activity. Others may wish to use proteolytic enzymes as laboratory tools. This book has been written with these investigators in mind and includes assay methods using natural and artificial substrates, genetic based assays and strategies for the inhibition, purification and crystallization of proteases. In selected chapters the use of proteolytic enzymes to analyze proteins, segregate cells or in peptide synthesis is covered.

Handbook of Algebra, 1995-12-18

Handbook of Algebra defines algebra as consisting of many different ideas, concepts and results. Even the nonspecialist is likely to encounter most of these either somewhere in the literature disguised as a definition or a theorem or to hear about them and feel the need for more information. Each chapter of the book combines some of the features of both a graduate level textbook and a research level survey. This book is divided into eight sections. Section 1A focuses on linear algebra and discusses such concepts as matrix functions and equations and random matrices. Section 1B covers linear dependence and discusses matroids. Section 1D focuses on fields, Galois Theory and algebraic number theory. Section 1F tackles generalizations of fields and related objects. Section 2A focuses on category theory including the topos theory and categorical structures. Section 2B discusses homological algebra, cohomology and cohomological methods in algebra. Section 3A focuses on commutative rings and algebras. Finally, Section 3B focuses on associative rings and algebras. This book will be of interest to mathematicians, logicians and computer scientists.

Space-Time Coding Branka Vucetic, Jinhong Yuan, 2003-06-02

The capacity of wireless data communications is lagging behind demands due to unsatisfactory performance of the existing wireless networks such as low data rates, low spectral efficiency and low quality of service. Space-time coding is an effective transmit diversity technique to combat fading in wireless communications. Space-time codes are a highly bandwidth efficient approach to signalling within wireless communication that takes advantage of the spatial dimension by transmitting a number of data streams using multiple co-located antennas. There are various approaches to the coding structures including space-time trellis coded modulation, space-time turbo codes and also layered architectures. The central issue in all these various coding structures is the exploitation of multipath effects in order to achieve very high spectral efficiencies. The spectral efficiencies of traditional wireless systems range between 1-5 bps/sec/Hz but by using space-time techniques, spectral efficiencies of 20-40 bps/sec/Hz have been possible.

Hence space time coding enables an increase in capacity by an order of magnitude This is the main reason why space time codes have been included in the standards for the third generation wireless communication systems and ultimately why Space time Coding will be in great demand by individuals within industry and academia The comprehensive understanding of space time coding is essential in the implementation of 3G and as the only title currently available Space Time Coding will be the standard text for Researchers telecommunication engineers and network planners academics and undergraduate postgraduate students telecommunications managers and consultants
