Abstract: Integrated watershed management (IWM) is becoming increasingly important in such a country where the economy depends predominately on agriculture, but there are also fast-growing urban populations that depend on water and food supplies on an unprecedented scale and attention is shifting to overall socio-economic benefit along with better water and soil conservation. The ever-increasing pressure on the natural resources is further increased the intensity by the even faster economic growth the country has witnessed in the past decades. Unprecedented economic activities in areas such as agriculture, industry, power, and communication, are affecting land-use patterns in many ways.

The aim of this paper is to emphasize the importance of the effective IWM, to point out the relations between its components and to realize on beneficiaries in any watershed. In particular, social, economic, environmental, and resource systems are all considered in order to improve the applicability of IWM approach.

This paper presents that watershed management integrates various aspects of forestry, agriculture, ecology, soils, water use and other sciences to provide guidelines for the choosing appropriate IWM alternatives within the social and economic context. Addressing social and economic aspects is an essential part of evaluating the effects of IWM.

Keywords: IWM, social, economic, environmental

INTRODUCTION

IWM is becoming increasingly important concept in all over the world and attention is shifting to overall socio-economic welfare along with better water and soil conservation. Global population is continuing to grow rapidly. The ever-increasing pressure on the natural resources is further increased the intensity by the even faster economic growth, the country has witnessed in the past decades. Unprecedented economic activity in areas such as agriculture, industry, power, and communication, is affecting land-use patterns in many ways.

Major increasingly challenging problems of socio-economic development in watersheds, e.g. scarcity of natural resources and environmental deterioration, have arisen. IWM is a useful tool for dealing with these issues and maintaining sustainable development at the watershed scale. According to Bouwer (2000), IWM is such a holistic approach which requires not only supply management, but also demand management (water conservation, transfer of water to uses with higher economic returns, etc.), water quality management, recycling and reuse of water, economics, public involvement, public health, environmental and ecological aspects, socio-cultural aspects, water storage (including long-term storage), conjunctive use of surface water and groundwater, water pollution control, flexibility, regional approaches, weather modification, sustainability, etc.
