

#### Conclusion:

The results of this experiment support the hypothesis by increasing the rate of change as the amount of extraction enzyme is increased. The enzyme increased overall from 25 mL to 5 mL, causing the rate of change to increase from 0.001 to 0.004. The extraction enzyme briefly attached to the hydrogen peroxide, separating it into water and oxygen. The hydrogen peroxide reacted with the glucose during its decomposition to produce the orange color in the solution. Errors could have been made in the incorrect measurement of reactants and the improper use of the colorimeter. In conclusion, the increase of an enzyme results in the increase in production of the components of its substrate. Improvements could have been made in testing even greater amounts of the extraction enzyme in order to obtain more conclusive results.

#### Discussion:

Does the substrate concentration influence the rate of reactions? Yes, with increased substrate concentration there is more available for the enzyme to catalyze and the reaction rate will increase.
