Plataniotis,Anastasios N. Venetsanopoulos,2013-04-17 Reporting the state of the art of color image processing this monograph fills an existing gap in the literature on digital signal and image processing It can serve the needs of different users at different levels as a textbook which covers a graduate image processing course as a up to date reference for researchers since it offers a broad survey of the relevant literature and as a relevant information source for development engineers who work in the design and the implementation of various image processing tasks Part of the material in the book was the basis of seminars at the University of Toronto The book contains numerous examples and pictures of color image processing results as well as tables which summarize the results of the analysis Algorithms implemented in JAVA can be downloaded from the author s website Clustering-based Colour Image Segmentation Rose Helena Turi,2001 A Contiguity-enhanced K-means Clustering Algorithm for Unsupervised Multispectral Image Segmentation ,1997 The recent and continuing construction of multi and hyper spectral imagers will provide detailed data cubes with information in both the spatial and spectral domain This data shows great promise for remote sensing applications ranging from environmental and agricultural to national security interests The reduction of this voluminous data to useful intermediate forms is necessary both for downlinking all those bits and for interpreting them Smart onboard hardware is required as well as sophisticated earth bound processing A segmented image in which the multispectral data in each pixel is classified into one of a small number of categories is one kind of intermediate form which provides some measure of data compression Traditional image segmentation algorithms treat pixels independently and cluster the pixels according only to their spectral information This

neglects the implicit spatial information that is available in the image We will suggest a simple approach a variant of the standard k means algorithm which uses both spatial and spectral properties of the image The segmented image has the property that pixels which are spatially contiguous are more likely to be in the same class than are random pairs of pixels This property naturally comes at some cost in terms of the compactness of the clusters in the spectral domain but we have found that the spatial contiguity and spectral compactness properties are nearly orthogonal which means that we can make considerable improvements in the one with minimal loss in the other **Colour Image Segmentation Using Perceptual Colour Difference Saliency Algorithm** Taiwo Tunmike Bukola,2017 **Objective Methods of Evaluating Colour Image Segmentation** Hassan Almuhairi,2010 <u>Color Image Edge Detection and Segmentation [electronic Resource] : A Comparison of the Vector Angle and the Euclidean Distance Color Similarity Measures</u> Slawomir Bogumil Wesolkowski,1999 This work is based on Shafer s dichromatic reflection model as applied to color image formation The color spaces RGB XYZ CIELAB CIELUV rgb l1l2l3 and the new h1h2h3 color space are discussed from this perspective Two color similarit y measures are studied the Euclidean distance and the vector angle The work in this thesis is motivated from a practical point of view by several shortcomings of current methods The first problem is the inability of all known methods to properly segment objects from the background without interference from object shadows and highlights The second shortcoming is the non examination of the vector angle as a distance measure that is capable of directly evaluating hue similarity without considering intensity especially in RGB Finally there is inadequate research on the combination of hue and intensity based similarity measures to improve color similarity calculations given the advantages of each color distance measure These distance measures were used for two image understanding tasks edge detection and one strategy for color image segmentation namely color clustering Edge detection algorithms using Euclidean distance and vector angle similarity measures as well as their combinations were examined The list of algorithms is comprised of the modified Roberts operator the Sobel operator the Canny operator the vector gradient operator and the 3x3 difference vector operator Pratt s Figure of merit is used for a quantitative comparison of edge detection results Color clustering was examined using the k means based on the Euclidean distance and mixture of principal components based on the vector angle algorithms A new quantitative image segmentation evaluation procedure is introduced to assess the performance of both algorithms Quantitative and qualitative results on many color images artificial staged scenes and natural scene images indicate good edge detection performance using a vector version of the Sobel operator on the h1h2h3 color space The results using combined hue and intensity based difference measures show a slight improvement qualitatively and over using each measure independently in RGB Quantitative and qualitative results for image segmentation on the same set of images suggest that the best image segmentation results are obtained using the mixture of principal components algorithm on the RGB XYZ and rgb color spaces Finally poor color clustering results in the h1h2h3 color space suggest that some assumptions in deriving a simplified version

of the dichromatic reflectance model might have been violated **Some Extensions of the K-means Algorithm for Image Segmentation and Pattern Classification** J. L. Marroquin,Massachusetts Institute of Technology. Artificial Intelligence Laboratory,F. Girosi,1993 We present some extensions to the k means algorithm for vector quantization that permit its efficient use in image segmentation and pattern classification tasks We show that by introducing a certain set of state variables it is possible to find the representative centers of the lower dimensional manifolds that define the boundaries between classes this permits one for example to find class boundaries directly from sparse data or to efficiently place centers for pattern classification The same state variables can be used to determine adaptively the optimal number of centers for clouds of data with space varying density Some examples of the application of these extensions are also given *Some Extensions of the K-means Algorithm for Image Segmentation and Pattern Classification* J. as well as the emerging area of multi spectral imaging Applications of color image processing presented via the examination of two case studies In addition to introducing readers to important new technologies in the field Digital Color Image Processing also contains novel topics such as techniques for improving three dimensional reconstruction three dimensional computer vision and emerging areas of safety and security applications in luggage inspection and video surveillance of high security facilities Complete with full color illustrations and two applications chapters Digital Color Image Processing is the only book that covers the breadth of the subject under one convenient cover It is written at a level that is accessible for first and second year graduate students in electrical and computer engineering and computer science courses and that is also appropriate for researchers who wish to extend their knowledge in the area of color image processing
