**Proceedings of the Twenty-Second Annual ACM Symposium on Principles of Distributed Computing**, 2003 This paper presents an efficient asynchronous protocol to compute RSA inverses with respect to a public RSA modulus  $N$  whose factorization is secret and shared among a group of parties Given two numbers  $x$  and  $e$  the protocol computes  $y$  such that  $ye \equiv x \pmod{N}$  A synchronous protocol for this task has been presented by Catalano Gennaro and Halevi Eurocrypt 2000 but the standard approach for turning this into an asynchronous protocol would require a Byzantine agreement sub protocol Our protocol adopts their approach but exploits a feature of the problem in order to avoid the use of a Byzantine agreement primitive Hence it leads to efficient asynchronous protocols for threshold signatures and for Byzantine agreement based on the strong RSA assumption without the use of random oracles
