

Why Choose Engineering

The consequences of failure or structural malfunction may include loss of human life, economic and environmental damages.

Durability/Safety analysis of structures will play an important role in reducing such accidents by checking the probability of failure at structural design stages.

It is known that construction works are complex processes that are associated with uncertainties at various level of their execution and use, which have to be taken into consideration during design. Structures undergo variations in physical states due to changes in weather, structural and serviceability parameters. Therefore, there is chance that the resistance of the structure will be less than the designed limits or the values of the forces acting on it will be higher than anticipated. Safety verifications of structures can be explained by the probability of going beyond the critical values by the physical measures.

With the knowledge gained when admitted for study, I would like to design robust structures to a greatest level of safety to avoid failure from happening.

I would like to make use of European technical regulations for design criteria to perform design durability analysis.

The title of my proposed topic is "Reliability-Based durability analysis of reinforced concrete member subjected to chloride ingress"

Time-dependent deterioration of concrete usually results from several actions, for example weather and ingress or migration of chemicals (chlorides, sulfates, carbon dioxides and moisture). The process normally starts with chloride penetration, followed by corrosion initiation, decrease in reinforcement diameter with cracking and ultimately loss of bearing capacity of the section.

I am looking to examine serviceability of the concrete member by checking the chloride concentration on reinforcements in concrete, which can be found through simulation for chloride migration analysis. The idea is to define the concentration levels at which corrosion happens during the design life. Simulation analysis will be carried out to determine the corrosion rate.

The loads that may be considered for the analysis are mechanical loads (self-weight), environmental loads (chloride and moisture) and any other load that is of importance in the design. The steps to be followed consist of analysis of all loads and their effect, defining the limit states, defining the reliability, defining the service life, and validation of th
