*General Concept of Real Estate Tokenization on Blockchain* Oleksii Konashevych, 2020 This paper presents a concept of real estate tokenization which includes legal technological and organizational aspects The research introduces a theory of a Title Token a digital record of ownership on the blockchain It is discussed the principle of technological neutrality where the traditional land registry is not necessarily abandoned in favor of blockchains but instead people gain the right to choose Nowadays public administrations use central server databases giving no alternatives for citizens Recognition of the right of citizens to choose which technology to apply for managing their property rights creates a basis for free competition and the development of new technologies for better public services

Decentralized distributed ledgers are the key to decentralization. They enable more secure automation of legal procedures. On the contrary, centralization is a source of many issues in governance: abuse of power, corruption, inefficient governance, and high costs, slowness, and complexity of bureaucratic procedures. With automation and reduction of intermediaries, the role of the government does not decrease but significantly changes: i.e., land cadaster bodies should not be monopolistic providers on the market. The paper introduces a theoretical basis for developing a new type of property registries.
