Immortal Cell:

The Immortal Cell Michael D. West, H. W. Brands, 2003 One scientist's quest to solve the mystery of human aging **Cell**

Immortalization Alvaro Macieira-Coelho, 1999-09-17 The problem of the long term proliferation of cells is a seminal one. It has always been a hot subject in biology, a source of far-reaching hypotheses, even more so now when explanations for the mechanisms of cell proliferative mortality or immortality seem within our reach. A question which is still debated is whether an infinite division potential can be a normal trait or is always the result of modifications leading to abnormal cell growth and escape from homeostasis. In general, investigators have been advocates of one of the two extremes: universal limited or unlimited normal proliferative potential. Since the long term proliferative potential of cells concerns regulation of development, regeneration of tissues, and homeostatic control of cell growth in brief survival of living organisms, and since the regulation of these processes is so different along the evolutionary scale, it is not surprising that there does not seem to be any universal trait. The question of whether cells are endowed with finite or infinite proliferative phenotypes has to be seen using the perspective of comparative biology.

Molecular Embryology Paul T. Sharpe, Ivor Mason, 2008-02-02 Most people have some interest in embryos; this probably results in part from their interest in understanding the biological origins of themselves and their offspring, and increasingly concerns about how environmental change such as pollution might affect human development. Obviously, ethical considerations preclude experimental studies of human embryos, and consequently the developmental biologist has turned to other species to examine this process. Fortunately, the most significant conclusion to be drawn from the experimental embryology of the last two decades is the manner in which orthologous or closely related molecules are deployed to mediate similar developmental processes in both vertebrates and invertebrates. The molecular mechanisms regulating processes fundamental to most animals, such as axial patterning or axon guidance, are frequently conserved during evolution. It is now widely believed that the differences between phyla and classes are the result of new genes arising mostly by duplication and divergence of extant sequences regulating the appearance of derived characters. Other vertebrates are obviously most likely to use the same developmental mechanisms as humans, and within the vertebrate subphylum the parent degree of conservation of developmental mechanism is considerable. It has long been recognized that particular vertebrate species offer either distinct advantages in investigating particular stages of development or are especially amenable to particular manipulations. No single animal can provide all the answers because not all types of experiments can be carried out on a single species.

Growth Control During Cell Aging Eugenia Wang, Huber R. Warner, 2020-08-11 The purpose of this book is to provide information on senescent cells and why they are prevented from multiplying via cell division. It includes main sections on the nature of G₀ 1 transition factors promoting the cell cycle traverse and avoiding the G₀ 1 arrest, and negative factors arresting the cell cycle traverse and promoting the stay in the G₀ 1 stage. Filled with illustrations and explanations, it collectively presents the mechanisms that control the cellular aging process. This reference is

Hu, 2012-12-06 Interest in the cell cycle has grown explosively in recent years as a result of the identification of key cell cycle regulators and their substrates Aside from enhancing our understanding of normal cellular growth controls this new knowledge has also been valuable in elucidating mechanisms of growth deregulation which occur in diseased states such as cancer and in some instances viral or parasitic infections The Thirteenth Washington International Spring Symposium was organized with the intention of bringing together scientists working on different aspects of the cell cycle Scientific topics presented ranged from molecular regulators and effectors to mitosis specific changes in cell architecture to the role of the cell cycle in development and disease The goal of this gathering was to help formulate a more comprehensive and integrated picture of events driving and being driven by the cell cycle as well as to evaluate the possibilities for clinical application of this knowledge This symposium held in Washington D C from May 10 14 1993 was attended by more than 400 scientists from 20 countries including many of the scientific leaders in this field This volume contains most of the papers presented at the seven plenary sessions in addition to selected contributions from a total of nine special oral and poster sessions **In Vitro Neurotoxicology** Evelyn Tiffany-Castiglioni, 2008-02-06 Well respected leaders in the field of in vitro neurotoxicology take a fresh look at their own and other's work critically and comparatively analyzing it across experimental systems and toxicants and synthesizing essential principles for in vitro neurotoxicity testing Neurotoxicants of significance to human health are emphasized especially those for which metabolism and dose responses are well studied both in vivo and in vitro lead mercury organophosphorous insecticides polychlorinated biphenyls and dioxin ethanol and endogenous proteins The goal is to set out new concepts and research directions that will hasten significant improvement in the methods and systems for in vitro neurotoxicity testing Fields' Virology David Mahan
