

UNIT-1

NUMERICAL METHOD

We use numerical method to find approximate solution of problems by numerical calculations with aid of calculator. For better accuracy we have to minimize the error.

Error = Exact value – Approximate value

Absolute error = modulus of error

Relative error = Absolute error / (Exact value)

Percentage error = 100 X Relative error

The error obtained due to rounding or chopping is called rounding error.

For example $\pi = 3.14159$ is approximated as 3.141 for chopping (deleting all decimal)

or 3.142 for rounding up to 3 decimal places.

Significant digit:

It is defined as the digits to the left of the first non-zero digit to fix the position of decimal point.

For example each of following numbers has 5 significant digits.

0.00025610, 25.610, 25601, 25610

Solution of Equations by Iteration:

Intermediate value Theorem: If a function $f(x)$ is continuous in closed interval $[a,b]$ and satisfies $f(a)f(b) < 0$ then there exists atleast one real root of the equation $f(x) = 0$ in open interval (a,b) .

Algebraic equations are equations containing algebraic terms (different powers of x). For example $x^2-7x+6=0$

Transcendental equations are equations containing non-algebraic terms like trigonometric, exponential, logarithmic terms. For example $\sin x - e^x = 0$

A. Fixed point iteration method for solving equation $f(x) = 0$

Procedure

Step-I We rewrite the equation $f(x) = 0$ of the form $x = h(x)$, $x=g(x)$, $x = D(x)$

We find the interval $[a,b]$ containing the solution (called root).

Step-II We choose that form say $x = h(x)$ which satisfies $|h'(x)| < 1$ in interval (a,b) containing the solution (called root).

Step-III We take $x_{n+1} = h(x_n)$ as the successive formula to find approximate solution (root) of the equation $f(x) = 0$

Step-III Let $x=x_0$ be initial guess or initial approximation to the equation $f(x) = 0$
