Balafoutis,Rajnikant V. Patel,2012-12-06 The purpose of this monograph is to present computationally efficient algorithms for solving basic problems in robot manipulator dynamics In particular the following problems of rigid link open chain manipulator dynamics are considered i computation of inverse dynamics ii computation of forward dynamics and iii generation of linearized dynamic models Com putationally efficient solutions of these problems are prerequisites for real time robot applications and simulations Cartesian tensor analysis is the mathematical foundation on which the above mentioned computational algorithms are based In particular it is shown in this monograph that by exploiting the relationships between second order Cartesian tensors and their vector invariants a number of new tensor vector identities can be obtained These identities enrich the theory of Cartesian tensors and allow us to manipulate complex Cartesian tensor equations effectively Moreover based on these identities the classical vector description for the Newton Euler equations of rigid body motion are rewritten in an equivalent tensor formulation which is shown to have computational advantages over the classical vector formulation Thus based on Cartesian tensor analysis a conceptually simple easy to

implement and computationally efficient tensor methodology is presented in this monograph for studying classical rigid body dynamics XII Application of this tensor methodology to the dynamic analysis of rigid link open chain robot manipulators is simple and leads to an efficient formulation of the dynamic equations of motion Engineering Mechanics, Dynamics Joseph F.
