

CHAPTER 4

Research Methodology and Design

4.1 Introduction

All research is based on some underlying philosophical assumptions about what constitutes 'valid' research and which research method(s) is/are appropriate for the development of knowledge in a given study. In order to conduct and evaluate any research, it is therefore important to know what these assumptions are. This chapter discusses the philosophical assumptions and also the design strategies underpinning this research study. Common philosophical assumptions were reviewed and presented; the interpretive paradigm was identified for the framework of the study. In addition, the chapter discusses the research methodologies, and design used in the study including strategies, instruments, and data collection and analysis methods, while explaining the stages and processes involved in the study.

The research design for this study is a descriptive and interpretive case study that is analysed through qualitative methods. Questionnaires were used to evaluate participants' WebCT skills (before the course starts) and to determine their levels of satisfaction in the course (at the end of the case study). A descriptive statistical method was used to analyze the student satisfaction survey. Participant observation, face-to-face interviews, focus-group interviews, questionnaires, and member checking were used as data collection methods. Furthermore, the justification for each of the data collection methods used in the study was discussed. Finally, in order to ensure trustworthiness of the research, appropriate criteria for qualitative research were discussed, and several methods that include member checks, peer reviews, crystallisation and triangulation were suggested and later employed. The chapter closed with a diagrammatic representation of the major facets of the envisaged framework for the research design and development of the study, and a discussion on the project management approach envisaged for this study.
