Bayesian Analysis in Natural Language Processing Shay Cohen, 2022-11-10 Natural language processing NLP went through a profound transformation in the mid 1980s when it shifted to make heavy use of corpora and data driven techniques to analyze language Since then the use of statistical techniques in NLP has evolved in several ways One such example of evolution took place in the late 1990s or early 2000s when full fledged Bayesian machinery was introduced to NLP This Bayesian approach to NLP has come to accommodate for various shortcomings in the frequentist approach and to enrich it especially in the unsupervised setting where statistical learning is done without target prediction examples We cover the methods and algorithms that are needed to fluently read Bayesian learning papers in NLP and to do research in the area These methods and algorithms are partially borrowed from both machine learning and statistics and are partially developed in house in NLP We cover inference techniques such as Markov chain Monte Carlo sampling and variational inference Bayesian estimation and nonparametric modeling We also cover fundamental concepts in Bayesian statistics such as prior distributions conjugacy and generative modeling Finally we cover some of the fundamental modeling techniques in NLP such as grammar modeling and their use with Bayesian analysis

Speech and Language Processing Dan Jurafsky, James H. Martin, 2009 This book takes an empirical approach to language processing based on applying statistical and other machine learning algorithms to large corpora Methodology boxes are included in each chapter Each chapter is built around one or more worked examples to demonstrate the main idea of the chapter Covers the fundamental algorithms of various fields whether originally proposed for spoken or written language to demonstrate how the same algorithm can be used for speech recognition and word sense disambiguation Emphasis on web and other practical applications Emphasis on scientific evaluation Useful as a reference for professionals in any of the areas of speech and language processing

Mathematical Foundations of Speech and Language Processing Mark Johnson, Sanjeev P. Khudanpur, Mari Ostendorf, Roni Rosenfeld, 2004-03-18 Speech and language technologies continue to grow in importance as they are used to create natural and efficient interfaces between people and machines and to automatically transcribe extract analyze and route information from high volume streams of spoken and written information The workshops on Mathematical Foundations of Speech Processing and Natural Language Modeling were held in the Fall of 2000 at the University of Minnesota's NSF sponsored Institute for Mathematics and Its Applications as part of a Mathematics in Multimedia year long program Each workshop brought together researchers in the respective technologies on the one hand and mathematicians and statisticians on the other hand for an intensive week of cross fertilization There is a long history of benefit from introducing mathematical techniques and ideas to speech and language technologies Examples include the source channel paradigm hidden Markov models decision trees exponential models and formal languages theory It is likely that new mathematical techniques or novel applications of existing techniques will once again prove pivotal for moving the field forward This volume consists of original contributions presented by participants during the two workshops Topics include language modeling prosody acoustic
