

ATOMS: ATOMIC STRUCTURE QUESTIONS AND ANSWERS

QUESTION ONE: MODELS OF THE ATOM (2011:1)

At different times scientists have proposed various descriptions or models of the atom to match experimental evidence available.

- (a) The model that Thomson proposed was called the plum-pudding model. Describe this model.
Thomson's model had a number of negative particles / corpuscles / electrons embedded in a (solid) positive sphere / cloud.
Cloud of particles or energy not accepted.
The atom as a whole is neutral because the charges are balanced.
Term "nucleus" not accepted.

Geiger and Marsden performed a series of experiments under the direction of Ernest Rutherford which led to a new model of the atom. A model of the gold foil experiment is shown below.

- (b) For each of the conclusions given below, state which observation from the experiment provides evidence that:
- (i) Most of the mass of the atom is concentrated in a tiny region which Rutherford called the nucleus.
Most of the alpha particles went straight through and a very small number / a few bounced back / were reflected.
- (ii) The nucleus is positively charged.
Some of the alpha particles were deflected ("deflection" is an observation, "repulsion" is not).
- (c) Rutherford included several features in the experiment due to the characteristics of the alpha particles. Discuss the reason for each of the features below:
- (i) The source of the alpha particles is at the end of a narrow lead tube
Tube: To provide a narrow (or collimated) beam of alpha particle.
OR to direct the alpha particles
OR ensure alpha hits perpendicular to gold foil
OR to avoid stray alpha particles affecting the results
- (ii) Vacuum chamber
Vacuum chamber – Alpha particles would not travel far / be stopped / lose energy / path would change / be deviated / collide with the air particles (cannot accept "affect", "disrupt", "react", "interfere").
OR
Alpha would become a helium atom / alpha particles ionise the air.
- (iii) Zinc sulfide screen
Alpha particles are not visible to the naked eye. The ZnS coating will show / glow / fluoresce / flash / give off light when alpha particles strike it (this may be implied as opposed to directly stated) but do not allow "detected" or "located"
