## ABSTRACT

The goal of this project is to build a four-quadrant DC motor speed control system. The motor has four quadrants of operation: clockwise, counter clockwise, forward brake, and reverse brake. It also features a speed control function. The DC motor's four-quadrant operation is best suited for industries where motors are used based on needs. They can rotate in both clockwise and counter clockwise directions, and brakes can be applied simultaneously in both directions. When performing a certain activity in an industrial plant, the motor must be stopped instantly. In this situation, the proposed system is ideal because it includes both forward and reverse brakes. Instantaneous braking in both directions is performed by briefly applying a reverse voltage across the running motor, and the motor's speed may be controlled using PWM pulses provided by the Arduino Board. This operation is performed using an Arduino Microcontroller Board. The motor is controlled by push buttons that are connected to the Arduino, which receives an input signal and regulates the speed of the motor with a motor driver IC. This project also has a speed control option with a push-button operation.

## I. INTRODUCTION

DC machines are extremely important in both industry and everyday life. DC machines have the distinct advantage of having easily adjustable properties. The goal of this study is to use Arduino to create a four-quadrant speed control system for a DC motor. The notion of four quadrant speed control of a dc motor, i.e., clockwise motion, anticlockwise motion, instantaneous forward braking, and immediate reverse braking, has been introduced in this work using Arduino and a motor driver (L293D). The same application is used to control the rudder of an aeroplane, an electric bicycle, or an electric car, among other things. A stationary magnet and revolving coils make up the motor. The brushes provide power to the coil located near the motor magnet pole pieces. The rotor rotates, and the polarity of each coil is reversed, and the motor rotates continuously. The rotational direction. Brush polarity affects the outcome. The torque applied to the rotor is determined by the current going through it through the tangles. The constant speed is determined by the current flowing through the coils as well as the load. The motor is driving the vehicle.
